

Introduction to Analysis I

Kon Yi

December 2, 2025

Abstract

The lecture note of 2025 Fall Introduction to Analysis I by professor 崔茂培. In this note, we will write $(X^{(n)})_{n=m}^{\infty}$ and $\{X^{(n)}\}_{n=m}^{\infty}$ to express a sequence, they are identical, but 崔茂培 use both during lectures, so I follow him.

Basic Things

Lecture 1

1.1 Natural Numbers

2 Sep. 09:10

The set of natural numbers is denoted by $\mathbb{N} = \{1, 2, \dots\}$. There exists an addition operation

$$1 + 1 = 2 \quad 1 + 1 + 1 = 3 \quad \underbrace{1 + 1 + \dots + 1}_{n \text{ times}} = n.$$

1.2 Integers

The set of integers is $\mathbb{Z} = \{0, \pm 1, \pm 2, \dots\}$. There is a zero element 0 such that $z + 0 = z$ for any $z \in \mathbb{Z}$. Also, for $n \in \mathbb{N}$, we have $n + (-n) = 0$ and $n - m = n + (-m)$ for all $n, m \in \mathbb{N}$.

$$\mathbb{Z} \xrightarrow[\text{introduce division}]{\hspace{1.5cm}} \mathbb{Q} \xrightarrow[\text{Completeness axiom}]{\hspace{1.5cm}} \mathbb{R}$$

1.3 Field

Next, we introduce the concept of field.

Definition 1.3.1 (Fields). A field is a set F together with two binary operations, called addition(+) and multiplication(*), such that the following properties hold:

- (a) $a + b = b + a$, $a \cdot b = b \cdot a$ for $a, b \in F$.
- (b) $(a + b) + c = a + (b + c)$, $(a \cdot b) \cdot c = a \cdot (b \cdot c)$ for $a, b, c \in F$.
- (c) $a \cdot (b + c) = a \cdot b + a \cdot c$.
- (d) There are distinct element 0 and 1 such that $a + 0 = a$, $a \cdot 1 = a$ for $a \in F$.
- (e) For each $a \in F$, there exists $-a \in F$ such that $a + (-a) = 0$. If $a \neq 0$, there is an element $\frac{1}{a}$ or a^{-1} in F such that $a \cdot \frac{1}{a} = 1$, or $a \cdot a^{-1} = 1$.

Remark 1.3.1. If $a \in F$, then $a + a \in F$. We denote $a + a$ by $2 \cdot a$. Similarly,

$$\underbrace{a + a + \dots + a}_{n \text{ times}} = n \cdot a,$$

and

$$a^n = \underbrace{a \cdot a \cdot \dots \cdot a}_{n \text{ times}}$$

if $a \in F$ and $n \in \mathbb{N}$.

Remark 1.3.2. In a field, we have subtraction and division $a - b = a + (-b)$ for $a, b \in F$. If $b \neq 0$, then $\frac{a}{b} = a \cdot b^{-1}$ for $a, b \in F$.

In a field F , we have

$$\begin{aligned} (a + b)^2 &= (a + b) \cdot (a + b) \\ &= (a + b) \cdot a + (a + b) \cdot b \\ &= a \cdot a + b \cdot a + a \cdot b + b \cdot b \\ &= a^2 + ab + ab + b^2 \\ &= a^2 + 2ab + b^2. \end{aligned}$$

Example 1.3.1.

$$\frac{a}{b} + \frac{c}{d} = \frac{ad + bc}{bd}$$

if $b \neq 0$ and $d \neq 0$.

Proof.

$$\begin{aligned} \frac{a}{b} + \frac{c}{d} &= a \cdot b^{-1} + c \cdot d^{-1} \\ &= ab^{-1}dd^{-1} + cd^{-1}bb^{-1} \\ &= adb^{-1}d^{-1} + cbd^{-1}b^{-1} \\ &= \frac{ad + bc}{bd}. \end{aligned}$$

Notice that this is true since we have commutativity in multiplication and

$$d^{-1}b^{-1} = (bd)^{-1} = \frac{1}{bd}.$$

■

Example 1.3.2. The set of rational numbers $\mathbb{Q} = \left\{ \frac{p}{q} \mid p, q \in \mathbb{Z}, q \neq 0 \right\}$ is a field.

Example 1.3.3. The set of real numbers is also a field.

Example 1.3.4. $F_2 = \{0, 1\}$ is also a field since we can define addition and multiplication like $0 + 0 = 0, 0 + 1 = 1, 1 + 1 = 0$, and $0 \cdot 0 = 0, 1 \cdot 0 = 0, 1 \cdot 1 = 1$.

1.4 Order Relation

Next, we introduce the order relation. The real number system is ordered by the relation $<$, which has the following properties.

- (f) For each pair of real numbers a and b , exactly one of the following is true: $a = b, a < b, b < a$.
- (g) If $a < b$ and $b < c$, then $a < c$.
- (h) If $a < b$, then $a + c < b + c$ for any c , and if $0 < c$, then $a \cdot c < b \cdot c$.

Definition 1.4.1. A field with an order relation satisfy (f) to (h) is called an ordered field.

Example 1.4.1. The set of rational numbers is an ordered field.

Example 1.4.2. F_2 is not an ordered field.

Proof. If $0 < 1$, then $1 = 0 + 1 < 1 + 1 = 0$, which is a contradiction. If $1 < 0$, then $0 = 1 + 1 < 0 + 1 = 1$, which is also a contradiction. ■

Notation. In an ordered field, we use $a \leq b$ to denote either $a < b$ or $a = b$.

1.5 Absolute Value and Triangle Inequality

Next, we define the absolute value of a real number

$$|a| = \begin{cases} a, & \text{if } a \geq 0; \\ -a, & \text{if } a \leq 0; \end{cases}$$

Theorem 1.5.1 (Triangle Inequality).

$$|a + b| \leq |a| + |b|$$

for all $a, b \in \mathbb{R}$.

Corollary 1.5.1.

$$||a| - |b|| \leq |a - b| \quad \text{and} \quad ||a| - |b|| \leq |a + b|$$

Proof. We write

$$|a| = |a - b + b| \leq |a - b| + |b|.$$

Similarly we have

$$|b| \leq |b - a| + |a|.$$

So

$$-|b - a| \leq |a| - |b| \leq |a - b|.$$

Thus,

$$||a| - |b|| \leq |a - b|. \quad \blacksquare$$

1.6 Supremum and Infimum

Next, we introduce the notion of supremum of a subset of real numbers.

Definition 1.6.1. Let S be a subset of \mathbb{R} ,

- (1) we say b is an upper bound of S if $x \leq b$ for all $x \in S$.
- (2) If B is an upper bound of S , and no number smaller than B is an upper bound of S , then B is called the supremum or the least upper bound of S . We write $B = \sup S$.

Corollary 1.6.1. If $B = \sup S$, then

- (1) $x \in S$ implies $x \leq B$

(2) If $b < B$, then b is not an upper bound of S , i.e. there exists $x_1 \in S$ such that $b < x_1$.

Definition 1.6.2. Let S be a subset of \mathbb{R} ,

- (1) we say b is a lower bound of S if $x \geq b$ for all $x \in S$.
- (2) If α is a lower bound of S , and no number bigger than α is a lower bound of S , then α is called the infimum or the greatest lower bound of S . We write $\alpha = \inf S$.

Corollary 1.6.2. If $\alpha = \inf S$, then

- (1) $x \in S$ implies $x \geq \alpha$
- (2) If $\alpha < a$, then a is not a lower bound of S , i.e. there exists $x_1 \in S$ such that $x_1 < a$.

Notation (Interval Notation).

$$(a, b) = \{x \mid a < x < b\}$$

$$(a, b] = \{x \mid a < x \leq b\}$$

$$[a, b) = \{x \mid a \leq x < b\}$$

Example 1.6.1. $S = \{x \mid x < 0\} = (-\infty, 0)$, then $\sup S = 0$ but $\inf S$ does not exist.

Example 1.6.2. $S_1 = \{-1, -2, -3, -4, \dots\} = \{-n \mid n \in \mathbb{N}\}$, then $\sup S = -1$, but $\inf S$ does not exist.

Definition 1.6.3 (Nonempty Sets). A nonempty set is that a set has at least one element. The empty set, written as \emptyset , is the set has no elements at all.

Example 1.6.3. $S = \{x \mid x \in \mathbb{Q}, x < \sqrt{2}\}$

In \mathbb{Q} , $\sup S$ does not exist. In \mathbb{R} , $\sup S = \sqrt{2}$.

Theorem 1.6.1 (Completeness axiom). If a nonempty set of real numbers (an ordered field) is bounded above, then it has a least upper bound or $\sup S$ exists.

Remark 1.6.1. This is an extra axiom that can't be derived from the properties of ordered field.

Remark 1.6.2. Up to "isomorphism", there is exactly one complete ordered field: the field of real numbers.

Remark 1.6.3. From now, we assume \mathbb{R} satisfies the completeness axiom. Thus, any nonempty subset $S \subseteq \mathbb{R}$ that is bounded above, we have $\sup S$ exists.

We can prove the following property of $\sup S$.

Theorem 1.6.2. If $S \subseteq \mathbb{R}$ is bounded above, then $\sup S$ is the unique real number B such that

- (i) $x \leq B$ for all $x \in S$
- (ii) for every $\varepsilon > 0$, there exist an $x_0 \in S$ such that $B - \varepsilon < x_0$.

Proof. (i), (ii) follows from the definition. We prove the uniqueness. Suppose $B_1 = \sup S = B_2$. We want to show $B_1 = B_2$. Suppose $B_1 \neq B_2$. Then either $B_1 < B_2$ or $B_2 < B_1$. However, if either one is true, then the other one cannot be $\sup S$. ■

Theorem 1.6.3 (Archimedean Property). If $p > 0$ and $\varepsilon > 0$, then there exists an $n \in \mathbb{N}$ such that $p < n\varepsilon$.

Proof. We prove this contradiction. Suppose it is not true. This implies $n\varepsilon \leq p$ for all $n \in \mathbb{N}$. Consider $S = \{n\varepsilon \mid n \in \mathbb{N}\}$, then p is an upper bound of S , so S is bounded above by p , so we know $B = \sup S$ exists. Hence, $n\varepsilon \leq B$ for all $n \in \mathbb{N}$, so we have $(n+1)\varepsilon \leq B$, which means

$$n\varepsilon \leq B - \varepsilon$$

for all $n \in \mathbb{N}$. This implies $B - \varepsilon$ is also an upper bound of S , which is a contradiction. ■

1.7 Density of other number system

Theorem 1.7.1. Every nonempty subset of the integers that is bounded below has a least element.

Proof. We first introduce an axiom:

Theorem 1.7.2 (Well-Ordering principle). Every non-empty subset of the natural numbers has a least element.

Note 1.7.1. Here, \mathbb{N} can be $\{0, 1, 2, \dots\}$ or $\{1, 2, 3, \dots\}$, which is not that important.

Now we call this subset of integers as S , and suppose we have m as a lower bound of S , then define $S' = \{s - m \mid s \in S\}$, then we know S' is a nonempty subset of \mathbb{N} , then by well-ordering principle we know there is a least element in S' and thus there is also a least element in S . ■

Corollary 1.7.1. Every nonempty subset of the integers that is bounded above has a greatest element.

Proof. Suppose M is an upper bound, then define a set $S' = \{M - s \mid s \in S\}$, then by well-ordering principle we know $M - a$ is the least element of S' for some $a \in S$, so we have $M - x \geq M - a$ for all $x \in S$, which means $a \geq x$ for all $x \in S$ and since $a \in S$, so a is the greatest element of S . ■

Theorem 1.7.3. The set of rational numbers is dense in the real number. That is, if a and b are real numbers with $a < b$, then there exists a rational number $\frac{p}{q}$ such that $a < \frac{p}{q} < b$.

Proof. Let $a, b \in \mathbb{R}$, $a < b$. By [Archimedean Property](#), $\exists q \in \mathbb{N}$ such that $q(b - a) > 1$. Let $S = \{m \mid m \text{ is an integer with } m > qa\}$, since we know $S \neq \emptyset$ and S is bounded below. Hence, $p = \inf S$ exists and is an integer by the last theorem. So $qa < p$ and $p - 1 \leq qa$, which means $qa < p \leq qa + 1 < qb$, so we have $a < \frac{p}{q} < b$. ■

Lecture 2

Definition 1.7.1 (Floor Function). For any real number x , the floor function of x is denoted by $\lfloor x \rfloor$, and is defined by the formula $\lfloor n \rfloor$ if $n \leq x < n + 1$ where $n \in \mathbb{Z}$.

Corollary 1.7.2.

$$\lfloor x \rfloor \leq x < \lfloor x \rfloor + 1.$$

4 Sep. 10:20

Example 1.7.1. $\lfloor 3.7 \rfloor = 3$, $\lfloor -1.2 \rfloor = -2$.

Now by floor function, we can reprove [Theorem 1.7.3](#).

Theorem 1.7.4 (Density of rational number in real number Again). The set of rational numbers is dense in the real number. That is, if a and b are real numbers with $a < b$, then there exists a rational number $\frac{q}{p}$ such that $a < \frac{q}{p} < b$.

Reprove Theorem 1.7.3. Since $a < b$, so we know $b - a > 0$. Now by [Archimedean Property](#), we know there exists $q \in \mathbb{N}$ such that $q(b - a) > 1$. Let $p = \lfloor qa \rfloor + 1$, we have

$$\lfloor qa \rfloor \leq qa < \lfloor qa \rfloor + 1 = p.$$

From our construction, $qb > qa + 1$, so we have

$$p = \lfloor qa \rfloor + 1 \leq qa + 1 < qb,$$

hence we have

$$qa \leq p \leq qb.$$

■

Note 1.7.2. For some reason, p, q in [Theorem 1.7.3](#) and [Theorem 1.7.4](#) are reversed.

Definition 1.7.2 (irrational number). x is called irrational if x is not rational.

Example 1.7.2. $\sqrt{2}$ is irrational.

Theorem 1.7.5. Let $r \in \mathbb{Q}$ and $x \in \mathbb{R} \setminus \mathbb{Q}$, then

1. $r + x$ is irrational.
2. If $r \neq 0$, then rx is irrational.

sketch of proof.

1. If $r + x = q \in \mathbb{Q}$, then $x = q - r \in \mathbb{Q}$, contradiction.
2. If $rx = q \in \mathbb{Q}$, then $x = \frac{q}{r} \in \mathbb{Q}$ since $r \neq 0$.

■

Theorem 1.7.6 (irrational number dense in real number). The set of irrational number is dense in real number. That is, if $a, b \in \mathbb{R}$ and $a < b$, then there exists a irrational number t such that $a < t < b$.

Proof. By [density of rational number](#), we can find $a < r_1 < r_2 < b$ where $r_1, r_2 \in \mathbb{Q}$, and then let $t = r_1 + \frac{1}{\sqrt{2}}(r_2 - r_1)$, then we know

$$a < r_1 < t < r_2 < b.$$

Note 1.7.3. We should use [Theorem 1.7.5](#) and the fact that $\sqrt{2}$ is irrational.

■

Definition 1.7.3 (bounded set). A set $S \subseteq \mathbb{R}$ is bounded if there are numbers a, b s.t. $a \leq x \leq b$ for all $x \in S$.

Corollary 1.7.3. A bounded non-empty set in \mathbb{R} has a unique supremum and a unique infimum and $\inf S \leq \sup S$.

1.8 Extended real number system

The real number system, together with ∞ and $-\infty$, then we have the following properties:

- (a) If $a \in \mathbb{R}$, then $a + \infty = \infty + a = \infty$ and $a - \infty = -\infty + a = -\infty$, and $\frac{a}{\infty} = \frac{a}{-\infty} = 0$.
- (b) If $a > 0$, then $a \cdot \infty = \infty \cdot a = \infty$ and $a \cdot (-\infty) = (-\infty) \cdot a = -\infty$
- (c) If $a < 0$, then $a \cdot \infty = \infty \cdot a = -\infty$ and $a \cdot (-\infty) = -\infty \cdot a = \infty$ and $\infty + \infty = \infty \cdot \infty = (-\infty) \cdot (-\infty) = \infty$ and $-\infty - \infty = \infty \cdot (-\infty) = (-\infty) \cdot \infty = -\infty$ and $|\infty| = |-\infty| = \infty$

However, there are some indeterminate form:

Theorem 1.8.1. The following things are not defined:

$$\infty - \infty, 0 \cdot \infty, \frac{\infty}{\infty}, \text{ and } \frac{0}{0}.$$

1.9 Mathematical Induction

Theorem 1.9.1 (Peano's Postulate). The natural numbers satisfy the following properties

- (a) \mathbb{N} is nonempty.
- (b) For each natural number n , there exists a unique rational number n called the successor of n .
- (c) There exists a natural number \bar{n} that is not the successor of any natural number.
- (d) Different natural numbers have different successors, that is, $n \neq m$ implies $n' \neq m'$.
- (e) The only subset of \mathbb{N} that contains \bar{n} and also contains the successor of every one of its element is \mathbb{N} .

Theorem 1.9.2 (Principle of Mathematical Induction). Let p_1, p_2, \dots, p_n be propositions, one for each positive integers, such that

- (a) p_1 is true.
- (b) for each positive integer n , p_n implies p_{n+1} .

then p_n is true for each $n \in \mathbb{N}$.

Proof. Let $M = \{n \mid n \in \mathbb{N} \text{ and } p_n \text{ is true}\}$, then from (a) we know $1 \in M$ and from (b) we know $n \in M$ implies $n + 1 \in M$. Hence, from (e) of [Peano's Postulate](#), we know $M = \mathbb{N}$. ■

Chapter 2

Metric Space

2.1 Definition and examples

Definition 2.1.1. Suppose $x_n \in \mathbb{R}$ for $n \geq m$. We use the notation $(x_n)_{n=m}^{\infty}$ to denote the sequence of numbers

$$x_m, x_{m+1}, \dots$$

We first recall the definition of a convergent sequence.

Definition 2.1.2 (Convergent Sequence). We say that a sequence $(x_n)_{n=m}^{\infty}$ of real numbers converges to x if for every $\varepsilon > 0$, there exists an $N \geq m$ s.t. $|x_n - x| \leq \varepsilon$ for all $n \geq N$.

Notation. We write $\lim_{n \rightarrow \infty} x_n = x$.

On \mathbb{R} , we can define the distance function between two points $x, y \in \mathbb{R}$ by $d(x, y) = |x - y|$. We'll discuss this more later.

Lemma 2.1.1. Let $(x_n)_{n=m}^{\infty}$ be a sequence of real numbers, and let x be another real number, then $(x_n)_{n=m}^{\infty}$ converges to x if and only if $\lim_{n \rightarrow \infty} d(x_n, x) = 0$.

Proof. Assume $(x_n)_{n=m}^{\infty}$ converges to x . Let $\varepsilon > 0$ be arbitrary real number. By definition, there exists an $N \geq m$ such that $|x_n - x| \leq \varepsilon$ for all $n \geq N$. But $d(x_n, x) = |x_n - x|$ by the definition. Hence, $\forall \varepsilon > 0, \exists N \geq m$ such that $d(x_n, x) \leq \varepsilon$ for all $n \geq N$. This implies that $\forall \varepsilon > 0, \exists N \geq m$ such that $|d(x_n, x) - 0| \leq \varepsilon$ for all $n \geq N$. This implies $\lim_{n \rightarrow \infty} d(x_n, x) = 0$.

The proof of the other side is the same but writing the above proof from bottom to top again.

Definition 2.1.3 (Metric Space). A metric space (X, d) is the space of X of objects (called points), together with a distance function or metric $d : X \times X \rightarrow [0, \infty)$ which associates to each x, y of points in X a nonnegative number $d(x, y) \geq 0$. Furthermore, the metric must satisfy 4 axioms.

- (a) For any $x \in X$, $d(x, x) = 0$.
- (b) (Positivity) For any distinct $x, y \in X$, we have $d(x, y) > 0$.
- (c) (Symmetry) For any $x, y \in X$, we have $d(x, y) = d(y, x)$.
- (d) (Triangle inequality) For any $x, y, z \in X$, we have $d(x, z) \leq d(x, y) + d(y, z)$.

Example 2.1.1. On \mathbb{R} , we can define $d(x, y) = |x - y|$.

Proof. • $d(x, y) = |x - y| \geq 0$.

- $d(x, y) = 0$ iff $|x - y| = 0$ iff $x = y$.
- $|x - y| = |y - x|$, so $d(x, y) = d(y, x)$
- $|x - z| \leq |x - y| + |y - z|$ for all $x, y, z \in \mathbb{R}$.

⊗

Example 2.1.2. Let (X, d) be a metric space and $Y \subseteq X$, then Y inherits a natural distance function

$$d|_{Y \times Y} : Y \times Y \rightarrow [0, \infty)$$

defined by $d|_{Y \times Y}(\alpha, \beta) = d(\alpha, \beta)$ for all $\alpha, \beta \in Y$.

Note 2.1.1. $(Y, d|_{Y \times Y})$ is called a metric subspace of (X, d) . It is obvious that $d|_{Y \times Y}$ is a metric on Y .

Recall \mathbb{R}^n . Let $x = (x_1, x_2, \dots, x_n), y = (y_1, y_2, \dots, y_n) \in \mathbb{R}^n$.

Definition 2.1.4 (l^2 -metric). The l^2 -metric is defined by

$$d_2(x, y) = \left(\sum_{i=1}^n (x_i - y_i)^2 \right)^{\frac{1}{2}} \quad (\text{or we called } d_{l_2}(x, y)).$$

Definition 2.1.5 (l^1 -metric(taxicab metric)). The l^1 -metric is defined by

$$d_1(x, y) = \sum_{i=1}^n |x_i - y_i| \quad (\text{or we called } d_{l_1}(x, y))$$

Definition 2.1.6 (l^∞ -metric). The l^∞ -metric is defined by

$$d_\infty(x, y) = \max_{1 \leq i \leq n} |x_i - y_i|$$

Exercise 2.1.1. Verify they are all metrics.

Note 2.1.2. Actually we have to define inner product and norm first and then we can use the triangle inequality of norm to prove d_2 is a metric. (See lecture notes by professor)

Lecture 3

Definition 2.1.7 (Cartesian Product). Let A, B be sets. The cartesian product of A and B is defined by

$$A \times B = \{(a, b) \mid a \in A, b \in B\}.$$

Similarly, the cartesian product of X_1, X_2, \dots, X_n is

$$X_1 \times X_2 \times \dots \times X_n = \{(x_1, x_2, \dots, x_n) \mid x_i \in X_i \forall 1 \leq i \leq n\}.$$

Definition 2.1.8 (Functions). Let X_1, X_2, \dots, X_n be sets and let Y be another set. A function of n variables with codomains is a map $f : X_1 \times X_2 \times \dots \times X_n \rightarrow Y$ which assigns each n -tuple (x_1, x_2, \dots, x_n) with $x_i \in X_i$ a unique element $f(x_1, x_2, \dots, x_n)$.

9 Sep. 09:10

Definition. We talk about the definition of domain, codomain, and range:

Definition 2.1.9. The domain of f is $X_1 \times X_2 \times \cdots \times X_n$ and Y is the codomain of f .

Definition 2.1.10. The range of f is

$$\{f(x_1, x_2, \dots, x_n) \in Y \mid x_i \in X_i \ \forall i\}.$$

In the definition of metric space, we write (X, d) to emphasize our set X and d is a distance function defined on $X \times X$, i.e.

$$d : X \times X \rightarrow [0, \infty) \subseteq \mathbb{R},$$

where

$$d : (x, y) \mapsto d(x, y)$$

for $x, y \in X$. Let (X, d) be a metric space and $Y \subseteq X$. Then $(Y, d|_{Y \times Y})$ is also a metric space with distance function defined by

$$d|_{Y \times Y} \rightarrow [0, \infty)$$

and

$$d|_{Y \times Y} : (\alpha, \beta) \mapsto d(\alpha, \beta) \text{ for } \alpha, \beta \in Y.$$

Example 2.1.3. Recall the **Taxi-cab metric**, it can be used in cryptography. For example, for two binary strings, we know

$$d_1((10010), (10101)) = 3 = \text{the number of mismatched bits.}$$

Example 2.1.4. Recall the **l^∞ -metric**. Suppose two jobs where each consists of 3 tasks, and the time (in hours) to complete each task is represented by a vector

$$x = (2, 4, 6), \ y = (3, 7, 5),$$

so

$$d_\infty(x, y) = \max\{|2 - 3|, |4 - 7|, |6 - 5|\} = 3.$$

Definition 2.1.11 (Lipschitz equivalent metrics). Let (X, d_1) and (X, d_2) be two metrics on X . We say d_1 and d_2 are Lipschitz equivalent if $\exists c_1, c_2 > 0$ s.t.

$$c_1 d_1(x, y) \leq d_2(x, y) \leq c_2 d_1(x, y) \quad \forall x, y \in X$$

Remark 2.1.1. They will have same topology (defined later).

Proposition 2.1.1. For all $x, y \in \mathbb{R}^n$,

$$d_2(x, y) \leq d_1(x, y) \leq \sqrt{n} d_2(x, y) \tag{2.1}$$

$$d_\infty(x, y) \leq d_2(x, y) \leq \sqrt{n} d_\infty(x, y) \tag{2.2}$$

Remark 2.1.2.

$$\begin{aligned} d_\infty(x, y) &\geq \frac{1}{\sqrt{n}} d_2(x, y) \\ &\geq \frac{1}{\sqrt{n}} \frac{1}{\sqrt{n}} d_1(x, y) = \frac{1}{n} d_1(x, y). \end{aligned}$$

Also,

$$d_\infty(x, y) \leq d_2(x, y) \leq d_1(x, y).$$

Remark 2.1.3. d_1, d_2, d_∞ are all Lipschitz equivalent.

proof of Proposition 2.1.1 . Recall $x = (x_1, \dots, x_n), y = (y_1, \dots, y_n)$, then

$$d_1(x, y) = \sum_{i=1}^n |x_i - y_i|, \quad d_2(x, y) = \left(\sum_{i=1}^n (x_i - y_i)^2 \right)^{\frac{1}{2}}.$$

By Cauchy-Schurwatz inequality,

$$\begin{aligned} d_1(x, y) &= \sum_{i=1}^n |x_i - y_i| \\ &\leq \left(\sum_{i=1}^n |x_i - y_i| \right)^{\frac{1}{2}} \left(\sum_{i=1}^n 1^2 \right)^{\frac{1}{2}} = \sqrt{n} d_2(x, y). \end{aligned}$$

Now we show that $d_1(x, y) \geq d_2(x, y)$.

$$\begin{aligned} (d_1(x, y))^2 &= \left(\sum_{i=1}^n |x_i - y_i| \right)^2 \\ &= \sum_{i=1}^n |x_i - y_i|^2 + 2 \sum_{1 \leq i < j \leq n} |x_i - y_i| |x_j - y_j| \\ &\geq \sum_{i=1}^n |x_i - y_i|^2 = d_2(x, y)^2. \end{aligned}$$

Hence, we have $d_1(x, y) \geq d_2(x, y)$.

Now we show that $d_2(x, y) \leq \sqrt{n} d_\infty(x, y)$. Note that

$$d_2(x, y) = \left(\sum_{i=1}^n |x_i - y_i|^2 \right)^{\frac{1}{2}}, \quad d_\infty(x, y) = \max_{1 \leq i \leq n} |x_i - y_i|.$$

For each i , we know

$$|x_i - y_i| \leq d_\infty(x, y),$$

so

$$d_2(x, y)^2 \leq \sum_{i=1}^n d_\infty(x, y)^2 = n d_\infty(x, y)^2,$$

so $d_2(x, y) \leq \sqrt{n} d_\infty(x, y)$. ■

Definition 2.1.12 (Discrete metric). Let X be any set, define the discrete metric:

$$d_{\text{disc}} : X \times X \rightarrow \{0, 1\}$$

where

$$d_{\text{disc}}(x, y) = \begin{cases} 0, & \text{if } x = y; \\ 1, & \text{if } x \neq y. \end{cases}$$

Why this is a metric? Because

- $d_{\text{disc}}(x, y) \geq 0$ for all $x, y \in X$ and $d(x, y) = 0$ if and only if $x = y$.
- $d_{\text{disc}}(x, y) = d_{\text{disc}}(y, x)$ by definition.
- $d_{\text{disc}}(x, z) \leq d_{\text{disc}}(x, y) + d_{\text{disc}}(y, z)$?

proof of triangle inequality in discrete metric. We first consider the case that $x = z$, then

$$d_{\text{disc}}(x, z) = 0,$$

so it is obviously that the triangle inequality is true.

Now if $x \neq z$, then either $y \neq z$ or $y \neq x$ must happen, so the triangle inequality must be true. ■

Example 2.1.5. We can define

$$d(x, x) = 0, \quad d(x, y) = \text{minimal length of a path from } x \text{ to } y,$$

then this is also a metric.

Figure 2.1: Graph metrics

Definition 2.1.13 (Convergence in metric space). Let m be an integer, (X, d) be a metric space, and let $(X^{(n)})_{n=m}^{\infty}$ be a sequence of points in X . Let $x \in X$. We say that $(X^{(n)})_{n=m}^{\infty}$ converges to x with respect to d iff

$$\lim_{n \rightarrow \infty} d(X^{(n)}, x) = 0,$$

where $\lim_{n \rightarrow \infty} d(X^{(n)}, x) = 0$ iff for every $\varepsilon > 0$, $\exists N \geq m$ s.t. $d(X^{(n)}, x) \leq \varepsilon$ for all $n \geq N$.

Notation. We also write $\lim_{n \rightarrow \infty} X^{(n)} = x$ in (X, d) .

Remark 2.1.4. Suppose $(X^{(n)})_{n=m}^{\infty}$ converges to x in (X, d) , then $(X^{(n)})_{n=m_1}^{\infty}$ also converges to x in (X, d) if $m_1 \geq m$.

Example 2.1.6. Let $(X^{(n)})_{n=1}^{\infty}$ denote the sequence $X^{(n)} = (\frac{1}{n}, \frac{1}{n})$ in \mathbb{R}^2 , then what will this sequence converges to for different metric?

Proof.

- If the metric is d_1 , then

$$d_1(X^{(n)}, (0, 0)) = \left| \frac{1}{n} - 0 \right| + \left| \frac{1}{n} - 0 \right| = \frac{2}{n},$$

so

$$\lim_{n \rightarrow \infty} d_1(X^{(n)}, (0, 0)) = \lim_{n \rightarrow \infty} \frac{2}{n} = 0.$$

- If the metric is d_2 , then

$$d_2 \left(X^{(d)}, (0, 0) \right) = \sqrt{\left(\frac{1}{n} - 0 \right)^2 + \left(\frac{1}{n} - 0 \right)^2} = \frac{\sqrt{2}}{n}.$$

Hence, under l_2 -metric $\{X^{(n)}\}$ also converges to 0.

- If the metric is d_∞ , then

$$d_\infty \left(X^{(n)}, (0, 0) \right) = \max \left\{ \left| \frac{1}{n} \right|, \left| \frac{1}{n} \right| \right\} = \frac{1}{n},$$

so it also converges to 0.

- If the metric is discrete metric, then however, it will not converges to $(0, 0)$ since

$$\lim_{n \rightarrow \infty} d_{\text{disc}} \left(X^{(n)}, (0, 0) \right) = \lim_{n \rightarrow \infty} d_{\text{disc}} \left(\left(\frac{1}{n}, \frac{1}{n} \right), (0, 0) \right) = 1.$$

⊛

Definition. Let $f : X \rightarrow Y$ be a function with domain X and codomain Y . The range of $f = \{f(x) \mid x \in X\} \subseteq Y$.

Definition 2.1.14 (injective). We say f is injective or one-to-one if for all $x_1, x_2 \in X$, $f(x_1) = f(x_2)$ implies $x_1 = x_2$.

Definition 2.1.15 (surjective). We say f is surjective or onto if for every $y \in Y$, $\exists x \in X$ s.t. $f(x) = y$.

Definition 2.1.16 (bijective). We say f is bijective if f is injective and surjective.

Corollary 2.1.1. If f is bijective, then there exists $f^{-1} : Y \rightarrow X$ defined by $f^{-1}(y) = x$ if $f(x) = y$. We also have

$$\begin{aligned} f(f^{-1}(y)) &= y \quad \forall y \in Y \\ f^{-1}(f(x)) &= x \quad \forall x \in X. \end{aligned}$$

Example 2.1.7. $\lim_{n \rightarrow \infty} \frac{1}{n} = 0$ in (\mathbb{R}, d) , where d is the standard metric in \mathbb{R} , which is defined by

$$d(x, y) = |x - y|.$$

But in different metric, $\lim_{n \rightarrow \infty} \frac{1}{n}$ may not be 0.

Proof. Define $f : [0, 1] \rightarrow [0, 1]$ defined by

$$f(x) = \begin{cases} x, & \text{if } 0 < x < 1; \\ 1, & \text{if } x = 0; \\ 0, & \text{if } x = 1. \end{cases}$$

f is bijective on $[0, 1]$ to $[0, 1]$

Define another metric d^1 on $[0, 1]$ by

$$d^1(x, y) = d(f(x), f(y)).$$

We want to show that d^1 is also a metric on $[0, 1]$.

- $d^1(x, y) = d(f(x), f(y)) = |f(x) - f(y)| \geq 0$
- $d^1(x, y) = 0$ iff $f(x) = f(y)$ iff $x = y$ since f is injective.
- The triangle inequality is trivially true since we can just use the triangle inequality in d .

In fact, $\lim_{n \rightarrow \infty} \frac{1}{n} = 1$ in $([0, 1], d^1)$ since

$$\lim_{n \rightarrow \infty} d^1\left(\frac{1}{n}, 1\right) = \lim_{n \rightarrow \infty} d\left(\frac{1}{n}, 0\right) = \lim_{n \rightarrow \infty} \left|\frac{1}{n}\right| = 0.$$

⊛

2.2 Some point set topology of metric space

Definition 2.2.1 (ball). Let (X, d) be a metric space. Let $x_0 \in X$ and $r > 0$. We define the ball $B_{(X, d)}(x_0, r)$ in X , centered at x_0 and with radius r in the metric d , to the set

$$B_{(X, d)}(x_0, r) := \{x \in X \mid d(x_0, x) < r\}.$$

Sometimes, we write it as $B_X(x_0, r)$ or $B(x_0, r)$.

Example 2.2.1. In \mathbb{R}^2 ,

$$B_{(\mathbb{R}^2, d_2)}((0, 0), 1) = \{(x, y) \mid d_2((x, y), (0, 0)) = \sqrt{x^2 + y^2} < 1\},$$

and

$$B_{(\mathbb{R}^2, d_1)}((0, 0), 1) = \{(x, y) \mid d_1((x, y), (0, 0)) = |x| + |y| < 1\},$$

and

$$B_{(\mathbb{R}^2, d_\infty)}((0, 0), 1) = \{(x, y) \mid d_\infty((x, y), (0, 0)) = \max\{|x|, |y|\} < 1\},$$

also we can consider the d_{disc} case but I am too lazy to write it down.

Notation. Let $E \subseteq X$, we will write

$$X \setminus E := \{x \in X \mid x \notin E\}.$$

Definition. Let (X, d) be a metric space and $E \subseteq X$. For a point $x_0 \in X$,

Definition 2.2.2 (interior point). x_0 is an interior point of E if $\exists r > 0$ s.t. $B(x_0, r) \subseteq E$.

Definition 2.2.3 (exterior point). x_0 is an exterior point of E if $\exists r > 0$ s.t. $B(x_0, r) \subseteq X \setminus E$.

Definition 2.2.4 (boundary point). x_0 is a boundary point of E if it is neither an interior point nor an exterior point of E .

Proposition 2.2.1. x_0 is a boundary point of E iff for all $r > 0$, $B(x_0, r) \cap E \neq \emptyset$ and $B(x_0, r) \cap (X \setminus E) \neq \emptyset$.

Lecture 4

11 Sep. 10:20

Theorem 2.2.1. Let (X, d_1) and (X, d_2) be metrics on X , and suppose d_1 and d_2 are Lipschitz equivalent, then for any sequence $\{x^{(n)}\}_{n=m}^{\infty} \subseteq X$ and any $x \in X$, we have

$$\lim_{n \rightarrow \infty} x^{(n)} = x \text{ in } (X, d_1) \Leftrightarrow \lim_{n \rightarrow \infty} x^{(n)} = x \text{ in } (X, d_2).$$

Proof. Since d_1, d_2 are Lipschitz equivalent, so there exists $c_1, c_2 > 0$ s.t.

$$c_1 d_1(x, y) \leq d_2(x, y) \leq c_2 d_1(x, y).$$

(\Rightarrow) Given $\frac{\varepsilon}{c_2} > 0$, since $\lim_{n \rightarrow \infty} x^{(n)} = x$ in (X, d_1) , so there exists N s.t. $N \geq m$ and

$$d_1(x^{(n)}, x) \leq \frac{\varepsilon}{c_2} \text{ for } n \geq N.$$

This implies $d_2(x^{(n)}, x) \leq c_2 d_1(x^{(n)}, x) \leq \varepsilon$ for $n \geq N$, which means

$$\lim_{n \rightarrow \infty} x^{(n)} = x \text{ in } (X, d_2).$$

(\Leftarrow) Similar. ■

Remark 2.2.1. On \mathbb{R}^n , the metrics d_1, d_2, d_{∞} are Lipschitz equivalent, that is,

$$\lim_{n \rightarrow \infty} x^{(n)} = x \text{ in } (\mathbb{R}^n, d_1) \Leftrightarrow \lim_{n \rightarrow \infty} x^{(n)} = x \text{ in } (\mathbb{R}^n, d_2) \Leftrightarrow \lim_{n \rightarrow \infty} x^{(n)} = x \text{ in } (\mathbb{R}^n, d_{\infty})$$

Proposition 2.2.2. Let (X, d_{disc}) be a discrete metric space, and $\{x^{(n)}\}_{n=m}^{\infty} \subseteq X$. Then

$$\lim_{n \rightarrow \infty} x^{(n)} = x \text{ in } (X, d_{\text{disc}}) \Leftrightarrow \exists N \geq m \text{ s.t. } x^{(n)} = x \text{ for } n \geq N.$$

Proof. (\Leftarrow) Easy.

(\Rightarrow) Given $\frac{1}{2} > 0$, there exists $N \geq m$ s.t. $d(x_n, x) < \frac{1}{2}$ for $n \geq N$, but $d(x_n, x) < \frac{1}{2}$ implies $d(x_n, x) = 0$, which means $x_n = x$ for all $n \geq N$. ■

Definition. We define the interior, exterior, and boundary point again.

Definition 2.2.5. The set of interior points is denoted by

$$\text{Int}(E) = \{x \in X \mid \exists r > 0 \text{ s.t. } B_X(x, r) \subseteq E\}.$$

Definition 2.2.6. The set of exterior points is denoted by

$$\text{Ext}(E) = \{x \in X \mid \exists r > 0 \text{ s.t. } B_X(x, r) \subseteq X \setminus E\}.$$

Definition 2.2.7. A point is a boundary points if it is neither an interior point nor an exterior point, and we define

$$\partial E = \{x \in X \mid x \notin \text{Int}(E) \text{ and } x \notin \text{Ext}(E)\}.$$

Remark 2.2.2.

1.

$$x_0 \notin \text{Int}(E) \Leftrightarrow \forall r > 0, B_X(x_0, r) \cap (X \setminus E) \neq \emptyset.$$

2.

$$x_0 \notin \text{Ext}(E) \Leftrightarrow \forall r > 0, B_X(x_0, r) \cap (E) \neq \emptyset.$$

3. $\text{Int}(X \setminus E) = \text{Ext}(E)$.4. $\partial E = \partial(X \setminus E)$ since

$$x_0 \in \partial E \Leftrightarrow x \notin \text{Int}(E) \text{ and } \text{Ext}(E) \Leftrightarrow x_0 \notin \text{Ext}(X \setminus E) \text{ and } x_0 \notin \text{Int}(X \setminus E).$$

Also,

$$x_0 \in \partial(X \setminus E) \Leftrightarrow x \notin \text{Int}(X \setminus E) \text{ and } \text{Ext}(X \setminus E) \Leftrightarrow x_0 \notin \text{Ext}(E) \text{ and } x_0 \notin \text{Int}(E).$$

Hence, acutually $\partial E = \partial(X \setminus E)$.**Proposition 2.2.3.**

$$x_0 \in \partial E \Leftrightarrow \text{For any } r > 0, B_X(x_0, r) \cap E \neq \emptyset \text{ and } B_X(x_0, r) \cap (X \setminus E) \neq \emptyset$$

Example 2.2.2. Let (\mathbb{R}, d) be the usual metric on \mathbb{R} , where

$$d(x, y) = |x - y|.$$

Then, we know in this space,

$$\begin{aligned} B_{\mathbb{R}}(x_0, r) &= \{x \in \mathbb{R} \mid d(x, x_0) < r\} \\ &= \{x \in \mathbb{R} \mid |x - x_0| < r\} \\ &= \{x \in \mathbb{R} \mid -r + x_0 < x < r + x_0\}. \end{aligned}$$

Hence, suppose $E = [1, 2]$, then $\text{Int}(E) = (1, 2)$ since we know $B(x_0, r) = (x_0 - r, x_0 + r)$, so for all $x \in (1, 2)$, we know there is an open ball $B(x_0, r) \subseteq [1, 2]$ for some $r > 0$. Also, consider the endpoint 1, 2, we can verify that these two points are not interior points. Besides, consider the points not in $[1, 2]$, it is trivial that they cannot be interior points.

Example 2.2.3. We consider (X, d_{disc}) . Let $E \subseteq X$. If $x \in E$, we know

$$B\left(x, \frac{1}{2}\right) = \left\{y \mid d(y, x) < \frac{1}{2}\right\} = \{x\} \subseteq E.$$

Hence, $E \subseteq \text{Int}(E)$. Besides, for all $x \in \text{Int}(E)$, we know there exists $r > 0$ s.t. $B(x_0, r) \subseteq E$, also we know $x_0 \in B(x_0, r) \subseteq E$, so $x_0 \in E$, and thus $\text{Int}(E) \subseteq E$. Hence, $E = \text{Int}(E)$. Similarly, $\text{Int}(X \setminus E) = X \setminus E$. Suppose there is a $x \in X$ s.t. $x \in \partial E$, then $x \notin \text{Int}(E) = E$ and $x \notin \text{Ext}(E) = \text{Int}(X \setminus E) = X \setminus E$, so such x does not exist.

Definition 2.2.8 (Closure). Let (X, d) be a metric space, and let $E \subseteq X$ and $x_0 \in X$. We say x_0 is an adherent point of E if for every $r > 0$, $B(x_0, r) \cap E \neq \emptyset$. The set of adherent points is called the closure of E , and denoted by \overline{E} .

Proposition 2.2.4 (TFAE).(a) x_0 is an adherent point of E .

- (b) x_0 is either an interior point or a boundary point of E .
 (c) \exists a sequence $\{X^{(n)}\}_{n=1}^{\infty}$ in E which converges to x_0 in (X, d) .

proof from (a) to (b). Suppose $x_0 \in \overline{E}$, then $B(x_0, r) \cap E \neq \emptyset$ for all $r > 0$. If $\exists s > 0$ s.t. $B(x_0, s) \subseteq E$, then $x_0 \in \text{Int}(E)$. If such s does not exist, then we know

$$B(x_0, r) \cap E \neq \emptyset \text{ and } B(x_0, r) \cap (X \setminus E) \neq \emptyset \text{ for all } r > 0,$$

so we can use [Proposition 2.2.1](#) to conclude that x_0 must be a boundary point. ■

proof from (b) to (c). Since either $x_0 \in \text{Int}(E)$ or $x_0 \in \partial E$. If $x_0 \in \text{Int}(E)$, then $x_0 \in E$, then we can choose $X^{(n)} = x_0$ for all $n \geq 1$. If $x_0 \in \partial E$, then given $n \in \mathbb{N}$, $\exists x_n \in B(x_0, \frac{1}{n}) \cap E \neq \emptyset$. Hence, $x_n \in E$ and $d(x_n, x_0) < \frac{1}{n}$. Pick such x_n to form $\{X^{(n)}\}_{n=1}^{\infty}$, then we know this sequence converges to x_0 . ■

proof from (c) to (a). Suppose $\{X^{(n)}\} \subseteq E$ s.t. $\lim_{n \rightarrow \infty} d(X^{(n)}, x_0) = 0$, then we want to show $x_0 \in \overline{E}$. Given any $r > 0$, choose $N \geq 1$ s.t.

$$d(X^{(n)}, x_0) < r \text{ when } n \geq N.$$

This implies for $n \geq N$, $X^{(n)} \in E$ and $X^{(n)} \in B(x_0, r)$, so we know $E \cap B(x_0, r) \neq \emptyset$ for all $r > 0$, which means $x_0 \in \overline{E}$. ■

Remark 2.2.3. The equation (a) and (b) implies $\overline{E} = \text{Int}(E) \cup \partial E$.

An alternative proof. Since we know $X = \text{Int}(E) \cup \text{Ext}(E) \cup \partial E$ by [Theorem 2.2.2](#), and $\overline{E} \subseteq X$, so

$$\begin{aligned} \overline{E} &= \overline{E} \cap X = \overline{E} \cap (\text{Int}(E) \cup \text{ext}(E) \cup \partial E) \\ &= (\overline{E} \cap \text{Int}(E)) \cup (\overline{E} \cap \text{Ext}(E)) \cup (\overline{E} \cap \partial E). \end{aligned}$$

Also, notice that

$$\overline{E} \cap \text{Int}(E) = \text{Int}(E) \quad \overline{E} \cap \text{Ext}(E) = \emptyset \quad \overline{E} \cap \partial E = \partial E,$$

so $\overline{E} = \text{Int}(E) \cup \partial E$. ■

Corollary 2.2.1. $\overline{E} = \text{Int}(E) \cup \partial E$.

Theorem 2.2.2. Let (X, d) be a metric space and $E \subseteq X$. Then,

$$X = \text{Int}(E) \cup \text{Ext}(E) \cup \partial E$$

Remark 2.2.4. ∂E could be empty. (See previous example.)

Corollary 2.2.2. Let (X, d) be a metric space and $E \subseteq X$. Then

$$\overline{E} = \text{Int}(E) \cup \partial E = X \setminus \text{Ext}(E).$$

Lemma 2.2.1. $\overline{E} = E \cup \partial E$

Proof. We first show that $E \cup \partial E \subseteq \overline{E}$. For every point $x \in E$, we know $x \in B(x, r)$ for all $r > 0$, so $B(x, r) \cap E \neq \emptyset$. Also, by definition, we know $\partial E \subseteq \overline{E}$, so we're done.

Next, we show that $\overline{E} \subseteq E \cup \partial E$. For every $x \in \overline{E}$, if $x \in E$, then $x \in E \cup \partial E$. If not, since $x \in \overline{E}$, so $B(x, r) \cap E \neq \emptyset$ for all $r > 0$. Also, since $x \notin E$, and $x \in B(x, r)$, so $B(x, r) \cap (X \setminus E) \neq \emptyset$,

otherwise $x \in B(x, r) \subseteq E$, which is a contradiction. Now we know for every $r > 0$, $B(x, r) \cap E \neq \emptyset$ and $B(x, r) \cap (X \setminus E) \neq \emptyset$, so $x \in \partial E$. ■

Lemma 2.2.2 (Discarded). If $x \in \text{Int}(E)$, then $x \in E$. In other words, $\text{Int}(E) \subseteq E$.

Proof. If $x \in \text{Int}(E)$, then there exists $r > 0$ s.t. $B(x, r) \subseteq E$, and thus $x \in B(x, r) \subseteq E$, which means $x \in E$. ■

Note 2.2.1. I thought we need [Lemma 2.2.2](#) to prove [Theorem 2.2.3](#), but I found it needless. Nevertheless, I still want to keep it since I think it is useful in some elsewhere.

Definition 2.2.9. Let (X, d) be a metric space and $E \subseteq X$. We say E is closed if $\partial E \subseteq E$. We say E is open if it doesn't contain any boundary points i.e. $\partial E \cap E = \emptyset$.

Theorem 2.2.3. E is closed if and only if $\overline{E} = E$.

Proof.

$$\begin{aligned} E \text{ is closed} &\Rightarrow \partial E \subseteq E \Rightarrow \overline{E} = E \cup \partial E = E. \\ E = \overline{E} = E \cup \partial E &\Rightarrow \partial E \subseteq E \Rightarrow E \text{ is closed.} \end{aligned}$$

■

Theorem 2.2.4. E is open. $\Leftrightarrow \text{Int}(E) = E$.

proof of (\Rightarrow) . E is open means $\partial E \cap E = \emptyset$. Fix $x \in E$, since $x \notin \partial E$, so $\exists r > 0$ s.t. $B(x, r) \cap E = \emptyset$ or $B(x, r) \cap (X \setminus E) = \emptyset$. Since $x \in E$ and $x \in B(x, r)$, so $B(x, r) \cap (X \setminus E) = \emptyset$, which means $B(x, r) \subseteq E$, so $x \in \text{Int}(E)$. Now we know $E \subseteq \text{Int}(E)$. Also, we know $\text{Int}(E) \subseteq E$ by [Lemma 2.2.2](#). Hence, $\text{Int}(E) = E$. ■

proof of (\Leftarrow) . If $\text{Int}(E) = E$, then given any $x \in E = \text{Int}(E)$, there exists $r > 0$ s.t. $B(x, r) \subseteq E$. Hence, $B(x, r) \cap (X \setminus E) = \emptyset$, so $x \notin \partial E$, and thus $E \cap \partial E = \emptyset$. ■

Theorem 2.2.5. If $E \subseteq X$, then E is open $\Leftrightarrow X \setminus E$ is closed.

proof of (\Rightarrow) . Since we can write $X = \text{Int}(E) \cup \text{Ext}(E) \cup \partial E$, and E is open, so

$$X \setminus E = (\text{Int}(E) \cup \text{Ext}(E) \cup \partial E) \setminus E = (\text{Int}(E) \cup \text{Ext}(E) \cup \partial E) \setminus \text{Int}(E) = \text{Ext}(E) \cup \partial E.$$

by [Theorem 2.2.4](#). Now we want to show that $\partial(X \setminus E) \subseteq X \setminus E$, and we know

$$X \setminus E = \text{Ext}(E) \cup \partial E = \text{Ext}(E) \cup \partial(X \setminus E)$$

since $\partial E = \partial(X \setminus E)$. Hence, we have $\partial(X \setminus E) \subseteq X \setminus E$. ■

proof of (\Leftarrow) . Suppose $X \setminus E$ is closed, then $\partial(X \setminus E) \subseteq X \setminus E$, and since $\partial E = \partial(X \setminus E)$, so $\partial E \subseteq X \setminus E$, and thus $\partial E \cap E = \emptyset$, which means E is open. ■

Lecture 5

Definition 2.2.10. Let (X, d) be a metric space, $E \subseteq X$ and $x_0 \in E$. We say x_0 is an adherent point if for every $r > 0$, $B(x_0, r) \cap E \neq \emptyset$, and we denote \overline{E} to the set of all adherent points.

16 Sep. 10:20

Remark 2.2.5. $E \subseteq \overline{E}$, since given any $x_0 \in E$ and $r > 0$, $x_0 \in B(x_0, r)$, so $B(x_0, r) \cap E \neq \emptyset$, and thus $E \subseteq \overline{E}$.

Remark 2.2.6. $\partial E \subseteq \overline{E}$. Given $x_0 \in \partial E$, we know for any $r > 0$, $B(x_0, r) \cap E \neq \emptyset$, so $x_0 \in \overline{E}$.

Proposition 2.2.5. $x_0 \in \overline{E}$ if and only if there exists $(X^{(n)})_{n=1}^{\infty} \subseteq E$ s.t. $\lim_{n \rightarrow \infty} X^{(n)}$ exists and $\lim_{n \rightarrow \infty} X^{(n)} = x_0$.

proof of (\Rightarrow) . Given $n \in \mathbb{N}$. Consider $B(x_0, \frac{1}{n})$. We know $B(x_0, \frac{1}{n}) \cap E \neq \emptyset$. Choose $X^{(n)} \in B(x_0, \frac{1}{n}) \cap E$, then $d(x_0, X^{(n)}) < \frac{1}{n}$, which means $\lim_{n \rightarrow \infty} d(x_0, X^{(n)}) = 0$. Hence, there exists $(X^{(n)}) \subseteq E$ s.t. $\lim_{n \rightarrow \infty} X^{(n)} = x_0$. ■

proof of (\Leftarrow) . There exists N s.t. $X^{(n)} \in B(x_0, r)$ when $n \geq N$. Given any $r > 0$, since $\lim_{n \rightarrow \infty} X^{(n)} = x_0$, so $\lim_{n \rightarrow \infty} d(X^{(n)}, x_0) = 0$. Hence, there exists N s.t. $d(X^{(n)}, x_0) < r$ when $n \geq N$. Hence, when $n \geq N$, we have $X^{(n)} \subseteq B(x_0, r)$. Since we know $X^{(n)} \in E$ for all n , so we know $B(x_0, r) \cap E \neq \emptyset$, so $x_0 \in \overline{E}$. ■

Proposition 2.2.6. Let (X, d) be a metric space and $E \subseteq X$, then

$$X = \text{Int}(E) \cup \text{Ext}(E) \cup \partial E.$$

Corollary 2.2.3. Let (X, d) be a metric space and $E \subseteq X$. Then,

$$\overline{E} = \text{Int}(E) \cup \partial E = X \setminus \text{Ext}(E) = E \cup \partial E.$$

Proof. Since

$$\begin{aligned} \overline{E} &= \overline{E} \cap X = \overline{E} \cap (\text{Int}(E) \cup \text{Ext}(E) \cup \partial E) \\ &= (\overline{E} \cap \text{Int}(E)) \cup (\overline{E} \cap \text{Ext}(E)) \cup (\overline{E} \cap \partial E) = \text{Int}(E) \cup \partial E. \end{aligned}$$

Also,

$$X \setminus \text{Ext}(E) = (\text{Int}(E) \cup \text{Ext}(E) \cup \partial E) \setminus \text{Ext}(E) = \text{Int}(E) \cup \partial E = \overline{E}.$$

Besides, we know $\text{Int}(E) \subseteq E \subseteq \overline{E}$, so

$$\overline{E} = \text{Int}(E) \cup \partial E \subseteq E \cup \partial E.$$

Also, by Remark 2.2.5 and Remark 2.2.6, we know $E \cup \partial E \subseteq \overline{E}$, so we know $\overline{E} = E \cup \partial E$. ■

Definition 2.2.11. Let (X, d) be a metric space and $E \subseteq X$. We say E is open iff $\partial E \cap E = \emptyset$. We say E is closed iff $\partial E \subseteq E$.

Proposition 2.2.7.

$$E \text{ is open} \Leftrightarrow \text{Int}(E) = E \Leftrightarrow X \setminus E \text{ is closed.}$$

proof of $E \text{ is open} \Leftrightarrow \text{Int}(E) = E$.

(\Rightarrow) Since E is open, so $\partial E \cap E = \emptyset$. Hence,

$$\begin{aligned} E &= E \cap X = E \cap (\text{Int}(E) \cup \text{Ext}(E) \cup \partial E) \\ &= (E \cap \text{Int}(E)) \cup (E \cap \text{Ext}(E)) \cup (E \cap \partial E) = \text{Int}(E) \cup (E \cap \partial E) = \text{Int}(E) \end{aligned}$$

since $E \cap \text{Ext}(E) = \emptyset$ and we know $\partial E \cap E = \emptyset$.

(\Leftarrow) Since $\text{Int}(E) = E$, and $\text{Int}(E) \cap \partial E = \emptyset$, so $E \cap \partial E = \emptyset$, and thus E is open.

proof of E is open $\Leftrightarrow X \setminus E$ is closed.

(\Rightarrow) $X = \text{Int}(E) \cup \text{Ext}(E) \cup \partial E$, so

$$X \setminus E = (\text{Int}(E) \cup \text{Ext}(E) \cup \partial E) \setminus \text{Int}(E) = \text{Ext}(E) \cup \partial E = \text{Int}(X \setminus E) \cup \partial(X \setminus E).$$

Hence, $\partial(X \setminus E) \subseteq X \setminus E$, which means $X \setminus E$ is closed.

(\Leftarrow) $X \setminus E$ is closed, then $\partial(X \setminus E) \subseteq X \setminus E$, but $\partial E = \partial(X \setminus E)$, so $\partial E \subseteq X \setminus E$, and thus $\partial E \cap E = \emptyset$.

Remark 2.2.7. If $\partial E = \emptyset$, then E is open and closed.

Definition 2.2.12 (Clopen). If a set S is closed and open, then S is clopen.

Remark 2.2.8. Let (X, d) be a metric space, then \emptyset is clopen, and we can deduce that X is also clopen since X is the complement of \emptyset and we know S is open iff $X \setminus S$ is closed.

Remark 2.2.9. In (\mathbb{R}, d) , where d is the standard metric, then the only clopen set is \mathbb{R} or \emptyset .

Remark 2.2.10. Let (X, d_{disc}) be the discrete metric space on X . Let E be any set, then E is open and closed. Given $x_0 \in E$, we know $B_{\text{disc}}(x_0, \frac{1}{2}) \subseteq E$, so $x_0 \in \text{Int}(E)$, which means $E = \text{Int}(E)$, so E is open. Now since $X \setminus E$ is also open, so E is closed. Thus, E is clopen.

Proposition 2.2.8. The following hold:

- (a) E is open iff $E = \text{Int}(E)$.
- (b) E is closed iff for every convergent sequence $(X^{(n)})_{n=1}^{\infty}$ in E , then the limit $\lim_{n \rightarrow \infty} X^{(n)} \in E$.
- (c) Let $r > 0$, then
 - (i) $\overline{B}(x_0, r) = \{x \in X \mid d(x, x_0) \leq r\}$ is closed.
 - (ii) $B(x_0, r) = \{x \in X \mid d(x, x_0) < r\}$ is open.
- (d) Any singleton $\{x_0\}$ where $x_0 \in X$ is closed.
- (e) E is open iff $X \setminus E$ is closed.
- (f)
 - (i) If E_1, \dots, E_n are open sets in X , then $E_1 \cap E_2 \cap \dots \cap E_n$ is open.
 - (ii) If F_1, \dots, F_n are closed, then $F_1 \cup \dots \cup F_n$ is closed.
- (g)
 - (i) If $\{E_\alpha\}_{\alpha \in I}$ is any collection of open sets in X , then $\bigcup_{\alpha \in I} E_\alpha$ is open.
 - (ii) If $\{F_\alpha\}_{\alpha \in I}$ is any collection of closed sets in X , then $\bigcap_{\alpha \in I} F_\alpha$ is closed.
- (h)
 - (i) If $E \subseteq X$, then $\text{Int}(E)$ is the largest open set that contained in E i.e. $\text{Int}(E)$ is open and if $V \subseteq E$ and V is open, then $V \subseteq \text{Int}(E)$.
 - (ii) If $E \subseteq X$, then \overline{E} is the smallest closed set containing E i.e. \overline{E} is closed and if $E \subseteq K$ and K is closed, then $\overline{E} \subseteq K$.

proof of (b).

(\Rightarrow) Since E is closed, so $\overline{E} = E$, and we know every convergent sequence $(X^{(n)})_{n=1}^{\infty}$ converges to x_0 with $x_0 \in \overline{E}$ by [Proposition 2.2.4](#). Thus, we have $x_0 \in E$.

(\Leftarrow) Assume that every convergent sequence in E has its limit in E . We want to prove that E is closed, i.e. that $X \setminus E$ is open.

Take any point $y \in X \setminus E$. Suppose, for contradiction, that every ball around y meets E . That is, for each $k \in \mathbb{N}$ there exists a point

$$x^{(k)} \in E \cap B(y, \frac{1}{k}).$$

Then, by construction, we have $x^{(k)} \rightarrow y$.

By our assumption, the limit of any convergent sequence from E must lie in E . Hence $y \in E$, contradicting the fact that $y \in X \setminus E$.

Therefore, there must exist some radius $r > 0$ such that

$$B(y, r) \cap E = \emptyset,$$

which means $B(y, r) \subseteq X \setminus E$. Thus every point of $X \setminus E$ is an interior point, so $X \setminus E$ is open. Hence E is closed. ■

proof of (c).

(i) To show that $\overline{B}(x_0, r)$ is closed, it suffices to show that $X \setminus \overline{B}(x_0, r)$ is open. Note that

$$X \setminus \overline{B}(x_0, r) = \{x \in X \mid d(x, x_0) > r\}.$$

Let $y \in X \setminus \overline{B}(x_0, r)$, then define $\varepsilon = d(x_0, y) - r > 0$, then we can similarly prove that $B(y, \varepsilon) \subseteq X \setminus \overline{B}(x_0, r)$. Hence, $X \setminus \overline{B}(x_0, r) = \text{Int}(X \setminus \overline{B}(x_0, r))$, and thus it is open.

(ii) If $y \in B(x_0, r)$, then $d(x_0, y) < r$. Let $\varepsilon = r - d(x_0, y) > 0$, then we claim that $B(y, \varepsilon) \subseteq B(x_0, r)$. Given $z \in B(y, \varepsilon)$, then $d(z, y) < \varepsilon$, then use triangle inequality we know $z \in B(x_0, r)$. ■

proof of (d). It suffices to show that $X \setminus \{x_0\}$ is open. Given $y \in X \setminus \{x_0\}$, so we can show that

$$B\left(y, \frac{d(y, x_0)}{2}\right) \subseteq X \setminus \{x_0\}.$$

Hence, $y \in \text{Int}(X \setminus \{x_0\})$, and thus $X \setminus \{x_0\}$ is open. ■

proof of (f).

(i) Given $x_0 \in E_1 \cap E_2 \cap \cdots \cap E_n$, then $x_0 \in E_i$ for all $1 \leq i \leq n$. Thus, there exists $r_i > 0$ s.t.

$$B(x_0, r_i) \subseteq E_i \quad \text{for each } 1 \leq i \leq n.$$

Let $r = \min\{r_1, \dots, r_n\} > 0$, then we know $B(x_0, r) \subseteq B(x_0, r_i) \subseteq E_i$ for all $1 \leq i \leq n$. Hence, $B(x_0, r) \subseteq E_1 \cap E_2 \cap \cdots \cap E_n$, and thus $E_1 \cap \cdots \cap E_n$ is open.

(ii) Now if F_1, \dots, F_n are closed, then $X \setminus F_1, \dots, X \setminus F_n$ are open. Since we know $\bigcap_{i=1}^n (X \setminus F_i)$ is open, and

$$\bigcap_{i=1}^n (X \setminus F_i) = X \setminus \left(\bigcup_{i=1}^n F_i \right),$$

so $X \setminus (\bigcup_{i=1}^n F_i)$ is open, which means $\bigcup_{i=1}^n F_i$ is closed. ■

proof of (g).

- (i) Suppose $x_0 \in \bigcup_{\alpha \in I} E_\alpha$, then there exists $\mathcal{B} \in I$ s.t. $x_0 \in E_{\mathcal{B}}$. Now since $E_{\mathcal{B}}$ is open, so there exists $r_{x_0} > 0$ s.t.

$$B(x_0, r_{x_0}) \subseteq E_{\mathcal{B}} \subseteq \bigcup_{i \in \alpha} E_\alpha.$$

Hence, $\bigcup_{\alpha \in I} E_\alpha$ is open.

- (ii)

$$\left(X \setminus \left(\bigcap_{\alpha \in I} F_\alpha \right) \right) = \bigcup_{\alpha \in I} (X \setminus F_\alpha)$$

is open since $X \setminus F_\alpha$ is open for all $\alpha \in I$, so we have $\bigcap_{\alpha \in I} F_\alpha$ is closed.

Remark 2.2.11.

- (1) $\bigcap_{\alpha \in I} E_\alpha$ may NOT be open. For example,

$$\bigcap_{i=1}^{\infty} \left(-\frac{1}{n}, \frac{1}{n} \right) = \{0\},$$

which is closed.

- (2) $\bigcup_{\alpha \in I} F_\alpha$ may NOT be closed. For example,

$$\bigcup_{i=1}^{\infty} \left[-1 + \frac{1}{n}, 1 - \frac{1}{n} \right] = (-1, 1),$$

which is open.

Note 2.2.2. In the proof of (f), if the index set I is infinite, then we can not pick $\min \{r_1, \dots, r_n\}$, so we can not deduce that (f) is correct when there infinitely many open sets or closed sets. ■

proof of (h).

- (i) We first claim that $\text{Int}(E)$ is open.

Proof. Since for all $x \in \text{Int}(E)$, $\exists r_x > 0$ s.t. $B(x, r_x) \subseteq E$, so

$$\text{Int}(E) = \bigcup_{x \in \text{Int}(E)} B(x, r_x),$$

and by (ii) of (c) and (i) of (g) in [Proposition 2.2.8](#), we know $\text{Int}(E)$ is open. ■

Now if we have $V \subseteq E$ and V is open, then $y \in V$ implies there exists $s > 0$ s.t. $B(y, s) \subseteq V$, and thus $B(y, s) \subseteq E$ since $V \subseteq E$. Hence, we know $y \in \text{Int}(E)$, and thus $V \subseteq \text{Int}(E)$.

- (ii) To show \overline{E} is closed, it suffices to show that $X \setminus \overline{E}$ is open. Note that

$$\overline{E} = X \setminus \text{Ext}(E) = X \setminus \underbrace{\text{Int}(X \setminus E)}_{\text{open}},$$

so \overline{E} is closed. Now if $E \subseteq K$ and K is closed, then if $x \in \overline{E}$, we have $B(x, r) \cap E \neq \emptyset$ for all $r > 0$. Hence, $B(x, r) \cap K \neq \emptyset$ since $E \subseteq K$, so $x \in \overline{K} = K$ (since K is closed). Thus, $\overline{E} \subseteq K$. ■

Lecture 6

2.3 Relative topology

18 Sep. 10:20

Let (X, d) be a metric space and $Y \subseteq X$, then $(Y, d|_{Y \times Y})$ is also a metric space.

Example 2.3.1. Consider (\mathbb{R}^2, d_2) and $X = \{(x, 0) \mid x \in \mathbb{R}\}$, then on $(X, d_2|_{X \times X}) = (X, d)$, it is also a metric space.

Proof. Since

$$d((x, 0), (y, 0)) = \sqrt{(x - y)^2 + 0^2} = |x - y|,$$

so it is obvious that d is a metric.

Note that X is not open in \mathbb{R}^2 . Also, if $E = \{(x, 0) \mid -1 < x < 1\}$, then E is not open in \mathbb{R}^2 , but E is open in $(X, d_2|_{X \times X})$. *

Example 2.3.2. Suppose $X = (-1, 1) \subseteq \mathbb{R}$, then $(X, d|_{X \times X})$ is a metric space. Consider $E = [0, 1)$, then we know E is not closed in (\mathbb{R}, d) since $1 \in \overline{E}$ but $1 \notin E$. But E is closed in $(X, d|_{X \times X})$ since $\overline{E} = E$ in $(X, d|_{X \times X})$.

Definition 2.3.1 (relatively open/close). Let (X, d) be a metric space and $Y \subseteq X$. We say E is relatively open (resp. closed) in Y if E is open (resp. closed) in $(Y, d|_{Y \times Y})$.

Note 2.3.1. In the following context, if we say E is open in Y , then we mean E is "relatively" open, and if we say E is closed in Y , then we mean E is relatively closed in Y .

Note 2.3.2. If E is open/closed in Y , then $E \subseteq Y$. Otherwise, we cannot define $d|_{Y \times Y}(a, b)$ for $a, b \in E \setminus Y$.

Remark 2.3.1. If $Y \subseteq X$, and $(X, d), (Y, d|_{Y \times Y})$ are both metric spaces, then

$$B_Y(x, r) = \{y \in Y \mid d(y, x) < r\} = B_X(x, r) \cap Y.$$

Remark 2.3.2. If E is relatively open in Y , then given $x_0 \in E$, $\exists r_0 > 0$ s.t. $B_X(x_0, r_0) \cap Y \subseteq E$. This is because by [Remark 2.3.1](#), we have

$$B_X(x_0, r_0) \cap Y = B_Y(x_0, r_0) \subseteq E.$$

Remark 2.3.3. A set $E \subseteq Y$ is relatively closed in Y if given any $r > 0$ and $x_0 \in Y$,

$$B_Y(x_0, r) \cap E \neq \emptyset,$$

then $x_0 \in E$. This is because "closed" gives $E = \overline{E}_Y$. Note that this statement is equivalent to

$$\text{If } x_0 \in \overline{E}_Y, \text{ then } x_0 \in E = E_Y.$$

Proposition 2.3.1. Let (X, d) be a metric space, and $Y \subseteq X$ and $E \subseteq Y$, then

- (1) E is relatively open in Y iff \exists open set V in (X, d) s.t. $E = V \cap Y$.
- (2) E is relatively closed in Y iff \exists closed set K in (X, d) s.t. $E = K \cap Y$.

proof of (1).

- (\Rightarrow) Given any $x \in E$, $\exists r_x > 0$ s.t. $B_X(x, r_x) \cap Y \subseteq E$. Let $V = \bigcup_{x \in E} B_X(x, r_x)$. Obviously, $V \cap Y = E$ and V is open.
- (\Leftarrow) Suppose $E = V \cap Y$, then given any $x \in E$, since V is open, so there exists $r > 0$ s.t. $B_X(x, r) \subseteq V$, and then $B_X(x, r) \cap Y \subseteq V \cap Y = E$. Since x is an interior point of E in Y , so $\text{Int}_Y(E) = E$, and thus E is open in Y . ■

proof of (2).

- (\Rightarrow) E is relatively closed in Y , then $Y \setminus E$ is relatively open, so there exists V open in X s.t. $Y \setminus E = V \cap Y$. Hence,

$$\begin{aligned} E &= Y \setminus (Y \setminus E) = (X \setminus (Y \setminus E)) \cap Y = (X \setminus (V \cap Y)) \cap Y \\ &= ((X \setminus V) \cup (X \setminus Y)) \cap Y \\ &= ((X \setminus V) \cap Y) \cup ((X \setminus Y) \cap Y) \\ &= (X \setminus V) \cap Y \end{aligned}$$

Let $E = (X \setminus V) \cap Y = K \cap Y$, then since $K = X \setminus V$ is closed in X , so we're done.

- (\Leftarrow) Suppose $E = K \cap Y$ for some closed K , then $Y \setminus E = (X \setminus K) \cap Y$, which means $Y \setminus E$ is relatively open in Y since $X \setminus K$ is open and by (a), so E is closed in Y . ■

Example 2.3.3. Let $X = [0, 1] \cup [2, 3] \subseteq \mathbb{R}$ with the standard metric $d(x, y) = |x - y|$ with $x, y \in X$, then

- (i) $[0, 1]$ is open and closed in X .
- (ii) $\partial_X[0, 1] = \emptyset$.

Proof.

- (i) We want to find V open in \mathbb{R} s.t.

$$[0, 1] = V \cap \overbrace{([0, 1] \cup [2, 3])}^X,$$

we can choose $V = (-\frac{1}{2}, \frac{3}{2})$, so $[0, 1]$ is open in X .

We want to find K closed in \mathbb{R} and

$$[0, 1] = K \cap ([0, 1] \cup [2, 3]),$$

and we can choose $K = [-\frac{1}{2}, \frac{3}{2}]$, so $[0, 1]$ is closed in X .

- (ii) If $x \in \partial_X[0, 1]$, then $B_X(x, r) \cap [0, 1]$ and $B_X(x, r) \cap [2, 3]$ are both nonempty for any $r > 0$. However, this is impossible for any x in X , so $\partial_X[0, 1] = \emptyset$. ⊛

2.4 Cauchy sequence and complete metric space

Definition 2.4.1 (subsequence). Suppose $(X^{(n)})_{n=m}^{\infty}$ is a sequence in (X, d) . Suppose $m \leq n_1 < n_2 < \dots$, then $(X^{(n_j)})_{j=1}^{\infty}$ is called a subsequence of $(X^{(n)})_{n=m}^{\infty}$.

Example 2.4.1. $X^{(n)} = (-1)^n$ for all $n \in \mathbb{N}$.

Proof.

$$\{X^{(2n)}\}_{n=1}^{\infty}$$

is a subsequence of $\{X^{(n)}\}_{n=1}^{\infty}$. ⊛

Lemma 2.4.1. Let $\{X^{(n)}\}_{n=m}^{\infty}$ be a convergent sequence with $\lim_{n \rightarrow \infty} X^{(n)} = x$, then every subsequence of $\{X^{(n)}\}_{n=m}^{\infty}$ also converges to x_0 .

Definition 2.4.2 (limit points). Suppose $(X^{(n)})_{n=m}^{\infty}$ is a sequence in (X, d) , then we say L is a limit point of $(X^{(n)})_{n=m}^{\infty}$ if for every $N \geq m$ and every $\varepsilon > 0$, there exists $n \geq N$ s.t. $d(X^{(n)}, L) \leq \varepsilon$.

Proposition 2.4.1. L is a limit point of $(X^{(n)})_{n=m}^{\infty}$ iff there exists a subsequence

$$(X^{(n_j)})_{j=1}^{\infty}$$

converges to L .

Proof.

(\Rightarrow) Assume L is a limit point, now we build a subsequence converges to L by an inductive method. Our goal is to build a subsequence $\{X^{(n_j)}\}_{j=1}^{\infty}$ so that

$$d(X^{(n_j)}, L) < \frac{1}{j} \quad \forall 1 \leq j.$$

For $j = 1$, pick $N = m$, and pick $\varepsilon < \frac{1}{1}$ to pick $n_1 \geq N$ s.t.

$$d(X^{(n_1)}, L) \leq \varepsilon < \frac{1}{1}.$$

Now suppose n_1, n_2, \dots, n_{k-1} are all chosen, then now we can pick $N = n_{k-1} + 1$ and $\varepsilon < \frac{1}{k}$, so that we can pick $n_k \geq N$ s.t. $d(X^{(n_k)}, L) \leq \varepsilon < \frac{1}{k}$, so we're done. Now we show that this subsequence converges to L . For every $\varepsilon > 0$, we know there exists $0 < \frac{1}{k} < \varepsilon$, so for all $K \geq k$, we have

$$d(X^{(K)}, L) < \frac{1}{K} \leq \frac{1}{k} < \varepsilon,$$

so we're done.

(\Leftarrow) Left as exercise to the reader. ■

Proposition 2.4.2. L is a limit point iff $L \in \bigcap_{N=1}^{\infty} \overline{S_N}$ where $S_N = \{X^{(K)}\}_{K \geq N}$.

Definition 2.4.3 (Cauchy sequence). Let $(X^{(n)})_{n=m}^{\infty}$ be a sequence in (X, d) . We say this sequence is a Cauchy sequence if for every $\varepsilon > 0$, there exists $N \geq m$ s.t. $d(X^{(j)}, X^{(k)}) < \varepsilon$ for all $j, k \geq N$.

Lemma 2.4.2. Suppose $(X^{(n)})_{n=m}^{\infty}$ converges in (X, d) , then $(X^{(n)})_{n=m}^{\infty}$ is a Cauchy sequence in (X, d) .

Proof. Suppose $\lim_{n \rightarrow \infty} X^{(n)} = X_0$, then for every $\frac{\varepsilon}{2} > 0$, there exists $N \geq m$ s.t. $d(X^{(n)}, X_0) < \frac{\varepsilon}{2}$ for all $n \geq N$. If $j, k \geq N$, then

$$d(X^{(j)}, X^{(k)}) \leq d(X^{(j)}, X_0) + d(X^{(k)}, X_0) < \frac{\varepsilon}{2} + \frac{\varepsilon}{2} = \varepsilon.$$

■

Example 2.4.2. A sequence in \mathbb{Q} may not converges in \mathbb{Q} .

Proof. See teacher's note.

⊛

Definition 2.4.4 (Complete space). A metric space (X, d) is complete iff every Cauchy sequence converges to some points in X .

Remark 2.4.1. $\mathbb{Q} \subseteq \mathbb{R}$, and (\mathbb{Q}, d) is not complete.

Remark 2.4.2. The limit of a convergent sequence in metric space is unique. If

$$\lim_{n \rightarrow \infty} x^{(n)} = y \quad \text{and} \quad \lim_{n \rightarrow \infty} x^{(n)} = z,$$

then suppose by contradiction, $y \neq z$. Then,

$$0 \leq d(y, z) \leq d(y, x^{(n)}) + d(x^{(n)}, z).$$

By squeeze theorem, we know $d(y, z) = 0$ and thus $y = z$.

Proposition 2.4.3. Let (X, d) be a metric space and let $(Y, d|_{Y \times Y})$ be a subspace of (X, d) . If $(Y, d|_{Y \times Y})$ is complete, then Y is closed in X .

Proof. We want to show that $Y = \overline{Y}$, so we want to show for all $y \in \overline{Y}$, we have $y \in Y$. Now for every $y \in \overline{Y}$, then by [Proposition 2.2.4](#), we know there exists a convergent sequence $\{Y^{(n)}\}_{n=1}^{\infty}$ in Y and converges to y . However, every convergent sequence is Cauchy, and since $(Y, d|_{Y \times Y})$ is complete, so $\{Y^{(n)}\}_{n=1}^{\infty}$ converges in Y , which means $y \in Y$, and we're done. ■

Proposition 2.4.4. If (X, d) is complete and $Y \subseteq X$ is closed, then $(Y, d|_{Y \times Y})$ is complete.

Proof. Given a Cauchy sequence $(X^{(n)})_{n=1}^{\infty}$ in Y , so this is also a Cauchy sequence in X , so it converges in X . If $\exists x_0 \in X$ s.t. $\lim_{n \rightarrow \infty} X^{(n)} = x_0$. Since Y is closed, so $Y = \overline{Y}$, and by [Proposition 2.2.4](#), we know $x_0 \in \overline{Y} = Y$, so $x_0 \in Y$, and thus $(X^{(n)})_{n=1}^{\infty}$ also converges in Y . ■

Lecture 7

Completeness of \mathbb{R}^n with d_2, d_1, d_{∞}

23 Sep. 09:10

As previously seen. (X, d_1) and (X, d_2) are Lipschitz equivalent if $\exists c_1, c_2 > 0$ s.t.

$$c_1 d_1(x, y) \leq d_2(x, y) \leq c_2 d_1(x, y) \quad \forall x, y \in X.$$

Theorem 2.4.1. Suppose (X, d_1) and (X, d_2) are Lipschitz equivalent, then

$$(X, d_1) \text{ is complete} \Leftrightarrow (X, d_2) \text{ is complete.}$$

Proof.

(\Rightarrow) Given any Cauchy sequence $(x^{(n)})_{n=1}^{\infty}$ in (X, d_2) , then since $d_1(x, y) \leq \frac{1}{c_1} d_2(x, y)$, so $(x^{(n)})_{n=1}^{\infty}$ is Cauchy in (X, d_1) . Since (X, d_1) is complete, so there exists $x \in X$ s.t. $\lim_{n \rightarrow \infty} x_n = x \in (X, d_1)$. However, $x \in (X, d_2)$, so (X, d_2) is complete.

(\Leftarrow) Similar. ■

Theorem 2.4.2. (\mathbb{R}^n, d_2) is a complete metric space.

Corollary 2.4.1. Since (\mathbb{R}^n, d_2) , (\mathbb{R}^n, d_1) , $(\mathbb{R}^n, d_{\infty})$ are Lipschitz equivalent, so they are all complete by [Theorem 2.4.1](#) and [Theorem 2.4.2](#).

2.5 Compact metric space

Definition 2.5.1 (Compact space). A metric space (X, d) is compact iff every sequence in (X, d) has at least one convergent subsequence converging in X . A subset $Y \subseteq X$ is compact if $(Y, d|_{Y \times Y})$ is compact. That is, $(Y, d|_{Y \times Y})$ is compact if for any sequence $(y^{(n)})_{n=1}^{\infty} \subseteq Y$, there exists a subsequence $(y^{(n_j)})_{j=1}^{\infty}$ and $y \in Y$ s.t. $\lim_{k \rightarrow \infty} y^{(n_k)} = y$.

Definition 2.5.2 (Bounded). Let (X, d) be a metric space and let $Y \subseteq X$. We say Y is bounded iff for any $x \in X$, there exists $r > 0$ s.t. $Y \subseteq B_X(x, r)$.

Theorem 2.5.1.

$$Y \text{ is bounded} \Leftrightarrow \exists x_0 \in X \text{ and } R > 0 \text{ s.t. } Y \subseteq B_X(x_0, R).$$

Proof. The " \Rightarrow " is easy, so we just prove the other direction. Given any $x \in X$, we can choose $r_x = R + d(x, x_0)$.

Claim 2.5.1. $Y \subseteq B_X(x, r_x)$.

Proof. Let $y \in Y$, we know

$$d(y, x) \leq d(y, x_0) + d(x_0, x) < R + d(x_0, x).$$

Hence, $y \in B_X(x, r_x)$. ⊗

Proposition 2.5.1. Let (X, d) be a compact metric space. Then (X, d) is complete and bounded. ■

Proof.

- We want to show that (X, d) is complete. Given any Cauchy sequence $(x^{(n)})_{n=1}^{\infty}$ in (X, d) , then since (X, d) is compact, so there exists a compact subsequence $(x^{(n_k)})_{k=1}^{\infty}$ in X s.t. $\lim_{k \rightarrow \infty} x^{(n_k)} = x$. Since $(x^{(n)})_{n=1}^{\infty}$ is Cauchy sequence and $(x^{(n_k)})_{k=1}^{\infty}$ converges to x , so $\lim_{n \rightarrow \infty} x^{(n)} = x$. (See [Theorem A.1.1](#))
- Consider $x_0 \in X$. Suppose X is not bounded, then $B(x_0, n)$ will not contain X for all n . For each $n \in \mathbb{N}$,

$$\exists y^{(n)} \in X \text{ and } y^{(n)} \notin B_X(x_0, n) \text{ i.e. } d(y^{(n)}, x_0) \geq n.$$

Hence, $\{y^{(n)}\}_{n=1}^{\infty}$ is a sequence in (X, d) with $d(y^{(n)}, x_0) \geq n$. Since (X, d) is compact, so there exists a convergent sequence $\{y^{(n_k)}\}_{k=1}^{\infty}$ and $y \in X$ s.t. $\lim_{k \rightarrow \infty} y^{(n_k)} = y$. Hence, there exists $R > 0$ s.t. $d(y, y^{(n_k)}) < R$ for all k which is big enough, but this means

$$n_k \leq d(y^{(n_k)}, x_0) \leq d(y^{(n_k)}, y) + d(y, x_0) < R + d(y, x_0),$$

which is a fixed value, but n_k can be arbitrary large, so this is a contradiction. ■

Corollary 2.5.1. Let (X, d) be a metric space and Y be a compact subset, then Y is closed and bounded.

Proof. Since Y is a compact subset, so $(Y, d|_{Y \times Y})$ is compact. Thus, Y is bounded by [Proposition 2.5.1](#). Hence, $\exists y_0 \in Y$ and $R > 0$ s.t.

$$Y \subseteq B_Y(y_0, R) = B_X(y_0, R) \cap Y \subseteq B_X(y_0, R).$$

Let $y \in \bar{Y}$, then $\exists (y^{(n)})_{n=1}^{\infty}$ in Y s.t. $\lim_{n \rightarrow \infty} y^{(n)} = y$. Also, since Y is compact, so for the convergent sequence $\{y^{(n)}\}_{n=1}^{\infty}$, there is a subsequence $\{y^{(n_k)}\}_{k=1}^{\infty}$ and $y_0 \in Y$ s.t. $\lim_{k \rightarrow \infty} y^{(n_k)} = y_0 \in Y$. By uniqueness of limit in metric space, we know $y = y_0$, and thus $y \in \bar{Y}$. Hence, $\bar{Y} = Y$. (Actually, by [Lemma 2.4.2](#), we know $\{y^{(n)}\}_{n=1}^{\infty}$ is Cauchy, and then by [Theorem A.1.1](#), we know $y = y_0$.) ■

Theorem 2.5.2 (Heine-Borel Theorem). Let (\mathbb{R}^n, d) be \mathbb{R}^n with $d = d_2, d_{\infty}, d_1$, and let $E \subseteq \mathbb{R}^n$, then

$$E \text{ is compact} \Leftrightarrow E \text{ is closed and bounded.}$$

Proof.

(\Rightarrow) Trivial by the corollary.

(\Leftarrow) Suppose E is closed and bounded. Given a sequence $(x^{(n)})_{n=1}^{\infty}$ in E . By [Bolzano-Weierstrass Theorem](#), every bounded sequence has a convergent subsequence. Since E is closed, so $E = \bar{E}$, and thus the convergent subsequence converges in E . Hence, E is compact. ■

Remark 2.5.1. In a metric space, closed and bounded do not imply compact but compact implies closed and bounded.

Example 2.5.1. Consider $(\mathbb{Z}, d_{\text{disc}})$, then \mathbb{Z} is bounded since $\mathbb{Z} \subseteq B_{\text{disc}}(0, 2)$ and \mathbb{Z} is closed in \mathbb{Z} but \mathbb{Z} is not compact since any subsequence of $\{n\}_{n \in \mathbb{N}}$ does not converge in $(\mathbb{Z}, d_{\text{disc}})$.

Theorem 2.5.3. Let (X, d) be a metric space, let Y be a compact subset of X . Let $(V_\alpha)_{\alpha \in A}$ be a collection of open sets in X , and suppose that $Y \subseteq \bigcup_{\alpha \in A} V_\alpha$ (i.e. $(V_\alpha)_{\alpha \in A}$ covers Y). Then, there exists a finite subset $F \subseteq A$ s.t. $Y \subseteq \bigcup_{\alpha \in F} V_\alpha$.

Proof. We prove by contradiction. Suppose there does not exist a finite subset $F \subseteq A$ s.t. $Y \subseteq \bigcup_{\alpha \in F} V_\alpha$. For each $y \in Y \subseteq \bigcup_{\alpha \in A} V_\alpha$, $\exists \alpha \in A$ s.t. $y \in V_\alpha$. Since V_α is open, so there exists $r > 0$ s.t. $B(y, r) \subseteq V_\alpha$. Define

$$r(y) = \sup \{r > 0 : B_X(y, r) \subseteq V_\alpha \text{ for some } \alpha \in A\}.$$

Note that $r(y) > 0$ for all $y \in Y$. Now if we pick $r_0 = \inf \{r(y) : y \in Y\}$, then $r_0 \geq 0$.

- Case 1: $r_0 = 0$, there exists $y^{(n)} \in Y$ s.t. $0 < r(y^{(n)}) < \frac{1}{n}$. Thus, $(y^{(n)})_{n=1}^\infty$ is a sequence in Y , and since Y is compact, so there exists a convergent subsequence $(y^{(n_k)})_{k=1}^\infty$ converging to $y_0 \in Y$. Also, there exists $\varepsilon > 0$ and $\alpha \in A$ s.t. $B_X(y_0, \varepsilon) \subseteq V_\alpha$. Since $\lim_{k \rightarrow \infty} d(y^{(n_k)}, y_0) = 0$, so there exists $N > 0$ s.t. $j \geq N$ implies

$$y^{(n_j)} \in B_X\left(y_0, \frac{\varepsilon}{2}\right).$$

Claim 2.5.2. For all $j \geq N$, $B(y^{(n_j)}, \frac{\varepsilon}{2}) \subseteq B(y_0, \varepsilon)$.

Proof. Suppose $z \in B(y^{(n_j)}, \frac{\varepsilon}{2})$, then $d(z, y^{(n_j)}) < \frac{\varepsilon}{2}$, and thus

$$d(z, y_0) \leq d(z, y^{(n_j)}) + d(y^{(n_j)}, y_0) < \frac{\varepsilon}{2} + \frac{\varepsilon}{2} = \varepsilon.$$

⊗

Now since $B_X(y_0, \varepsilon) \subseteq V_\alpha$, so for $j \geq N$, $B(y^{(n_j)}, \frac{\varepsilon}{2}) \subseteq V_\alpha$, which means

$$r(y^{(n_j)}) \geq \frac{\varepsilon}{2} > 0.$$

However, this contradicts to the assumption that $r(y^{(n_j)}) < \frac{1}{n_j}$ for all j . Hence, Case 1 is impossible.

- Case 2: $\infty > r_0 > 0$. We know $r_0 \leq r(y)$ for all $y \in Y$ by definition. Hence, $0 < \frac{r_0}{2} < r(y)$. This means for each $y \in Y$, there exists $\alpha \in A$ s.t. $B_X(y, \frac{r_0}{2}) \subseteq V_\alpha$. Choose a point $y^{(1)} \in Y$ s.t. $\exists \alpha_1 \in A$ s.t. $B_X(y^{(1)}, \frac{r_0}{2}) \subseteq V_{\alpha_1}$. Since V_{α_1} cannot cover Y , so there exists $y^{(2)} \in Y$ and $y^{(2)} \notin B_X(y^{(1)}, \frac{r_0}{2}) \subseteq V_{\alpha_1}$. Hence, $d(y^{(2)}, y^{(1)}) \geq \frac{r_0}{2}$. Now we set the induction hypothesis: Suppose there exists $y^{(1)}, \dots, y^{(k)} \in Y$ and $\alpha_1, \dots, \alpha_k \in A$ s.t.

$$B_X\left(y^{(j)}, \frac{r_0}{2}\right) \subseteq V_{\alpha_j} \text{ and } d(y^{(i)}, y^{(j)}) \geq \frac{r_0}{2} \quad \forall i \neq j,$$

and $B_X(y^{(1)}, \frac{r_0}{2}) \cup \dots \cup B_X(y^{(k)}, \frac{r_0}{2})$ cannot cover Y , then we can find

$$y^{(k+1)} \notin B_X(y^{(1)}, \frac{r_0}{2}) \cup \dots \cup B_X(y^{(k)}, \frac{r_0}{2}),$$

and thus $d(y^{(k+1)}, y^{(i)}) \geq \frac{r_0}{2}$ for $1 \leq i \leq k$. Also, $\exists \alpha_{k+1}$ s.t. $B(y^{(k+1)}, \frac{r_0}{2}) \subseteq V_{\alpha_{k+1}}$. Now we know $B(y^{(1)}, \frac{r_0}{2}) \cup \dots \cup B(y^{(k+1)}, \frac{r_0}{2})$ won't cover Y , then $\{y^{(k)}\}_{k=1}^\infty$ is a sequence in Y and $d(y^{(j)}, y^{(l)}) \geq \frac{r_0}{2}$. Since Y is compact, so there exists a subsequence of $\{y^{(k)}\}_{k=1}^\infty$ which is convergent, but it is impossible, so we have a contradiction.

- Case 3: $r_0 = \infty$. If so, then it means $\inf \{r(y) : y \in Y\} = \infty$, so $r(y) = \infty$ for all $y \in Y$, otherwise if for some $y' \in Y$, $r(y')$ is finite, then $r_0 \leq r(y')$, and will get a contradiction. Now we have $r(y) = \infty$ for all $y \in Y$. This means for all $r > 0$, there exists some $\alpha \in A$ s.t.

$B_X(y, r) \subseteq V_\alpha$. Now since Y is compact, so Y is bounded, which means for all $y \in Y$, there exists r_y s.t. $Y \subseteq B_X(y, r_y)$. However, since $r(y) = \infty$ and by the previous argument, we know $B_X(y, r_y) \subseteq V_{\alpha_y}$ for some $\alpha_y \in A$, and thus $Y \subseteq V_{\alpha_y}$, and thus V_{α_y} covers Y , which is a contradiction. ■

Lecture 8

25 Sep. 10:20

Theorem 2.5.4 (Review [Theorem 2.5.3](#)). Let Y be a compact subset of a metric space (X, d) and let $\{V_\alpha\}_{\alpha \in A}$ be an open cover of Y . Then \exists a finite subcover of $\{V_\alpha\}_{\alpha \in A}$ i.e. $\exists \alpha_1, \dots, \alpha_n \in A$ s.t. $Y \subseteq \bigcup_{i=1}^n V_{\alpha_i}$.

Remark 2.5.2.

Y is compact \Leftrightarrow Any open cover of Y has a finite subcover.

Proof. The (\Rightarrow) direction is proved. Now we prove the other direction.

Claim 2.5.3. If (X, d) is a metric space and for all open cover of X , there exists finite subcover of X , then X is complete.

Proof. We will prove this by contradiction, using the definition of compactness (the open cover property).

1. Assumption Assume for the sake of contradiction that X is **compact** but **not complete**. Since X is not complete, there exists a **Cauchy sequence** $\{x_n\}_{n=1}^\infty$ in X that **does not converge** to any point $p \in X$.

2. Constructing the Open Cover Since $\{x_n\}$ does not converge to a point $p \in X$, for every $p \in X$, the point p is not the limit of the sequence. This means there exists some $\epsilon_p > 0$ such that the open ball $B_{\epsilon_p}(p)$ contains only a **finite number of terms** of the sequence $\{x_n\}$.

To see why, suppose for a contradiction that there was some $p \in X$ such that for all $\epsilon > 0$, the ball $B_\epsilon(p)$ contains an infinite number of terms of $\{x_n\}$. Let $\{x_{n_k}\}$ be a subsequence with $x_{n_k} \in B_{1/k}(p)$. This subsequence converges to p . Since $\{x_n\}$ is a Cauchy sequence and has a convergent subsequence, the entire sequence $\{x_n\}$ must converge to the same limit p , which contradicts our initial assumption. Therefore, the property holds: for every $p \in X$, there is an $\epsilon_p > 0$ such that $B_{\epsilon_p}(p)$ contains x_n for only finitely many n .

Consider the collection of open balls $\mathcal{U} = \{B_{\epsilon_p}(p) : p \in X\}$. Since the union of these balls covers every point $p \in X$, \mathcal{U} is an **open cover** of X :

$$X \subseteq \bigcup_{p \in X} B_{\epsilon_p}(p).$$

3. Using Compactness to Find a Finite Subcover Since X is **compact**, the open cover \mathcal{U} must have a **finite subcover**. That is, there exist a finite number of points $p_1, p_2, \dots, p_k \in X$ such that

$$X \subseteq B_{\epsilon_{p_1}}(p_1) \cup B_{\epsilon_{p_2}}(p_2) \cup \dots \cup B_{\epsilon_{p_k}}(p_k) = \bigcup_{i=1}^k B_{\epsilon_{p_i}}(p_i).$$

4. Reaching the Contradiction By the definition of ϵ_{p_i} , each ball $B_{\epsilon_{p_i}}(p_i)$ contains x_n for only a **finite number** of indices n . The union of a finite number of finite sets is a finite set. Therefore, the finite union $\bigcup_{i=1}^k B_{\epsilon_{p_i}}(p_i)$ can contain x_n for only a finite number of indices n . However, since this finite union covers all of X (step 3), it must contain **all** terms of the sequence $\{x_n\}_{n=1}^\infty$. Since the sequence $\{x_n\}$ is an infinite set of points, this is a **contradiction**.

The initial assumption that X is not complete must be false. Thus, every compact metric space is complete. ⊛

Suppose any open cover of Y has a finite subcover, then given any sequence $(y^{(n)})_{n=1}^{\infty}$. Consider

$$\bigcup_{x \in Y} B_Y(x, 1),$$

then this is an open cover of Y , and now we know there is a finite subcover

$$\bigcup_{i=1}^k B_Y(x_i, 1)$$

of Y where $x_i \in Y$ for all i . Now since $(y^{(n)})_{n=1}^{\infty}$ has infinitely many terms, so we know for some i , we have infinitely many terms of $(y^{(n)})_{n=1}^{\infty} \subseteq B_Y(x_i, 1)$ by Pigeonhole principle. Hence, there are infinitely many terms of $(y^{(n)})_{n=1}^{\infty}$ are in

$$\left\{ y \in Y : 0 \leq d(y, x_i) < \frac{1}{2} \right\} \cup \left\{ y \in Y : \frac{1}{2} \leq d(y, x_i) < 1 \right\}.$$

Thus, again, by Pigeonhold principle we know there are infinitely many terms of $(y^{(n)})_{n=1}^{\infty}$ are in either one of the above two sets. By repeating split the space into half as what we do above, we know for all $k \geq 0$, there are infinitely many terms of $(y^{(n)})_{n=1}^{\infty}$ has the following property: Every two terms of these "infinitely many terms" has distance less than $\frac{1}{2^k}$. Note that this means we can pick a subsequence of $(y^{(n)})_{n=1}^{\infty}$ so that it is Cauchy, and since every Cauchy sequence converges in Y (Since [Claim 2.5.3](#)), so we're done. ■

Corollary 2.5.2. Let (X, d) be a metric space and let K_1, K_2, \dots be a sequence of nonempty compact subsets of X s.t. $K_{i+1} \subseteq K_i$ for $i \in \mathbb{N}$, that is, $K_1 \supseteq K_2 \supseteq K_3 \supseteq \dots$ for $i \in \mathbb{N}$, then

$$\bigcap_{i=1}^{\infty} K_i \neq \emptyset.$$

Proof. Suppose $\bigcap_{i=1}^{\infty} K_i = \emptyset$. Since K_i 's are compact, so they are closed. Also, we have

$$\bigcup_{i=1}^{\infty} (K_1 \setminus K_n) = K_1 \setminus \left(\bigcap_{i=1}^{\infty} K_n \right) = K_1.$$

Let $V_i = K_1 \setminus K_i = K_1 \cap K_i^C$. Note that K_i^C is open in X . Hence, we have V_i is open in K_1 , and thus $\{V_i\}_{i=1}^{\infty}$ is an open cover of K_1 in K_1 . ($(K_1, d|_{K_1 \times K_1})$ is compact.) By [Theorem 2.5.3](#), we know there exists $\alpha_1, \alpha_2, \dots, \alpha_l$ with $\alpha_1 < \alpha_2 < \dots < \alpha_l$ s.t.

$$\begin{aligned} K_1 &\subseteq \bigcup_{i=1}^l V_{\alpha_i} = \bigcup_{i=1}^l (K_1 \setminus K_{\alpha_i}) \\ &= K_1 \setminus \bigcap_{i=1}^l K_{\alpha_i} = K_1 \setminus K_{\alpha_l} \end{aligned}$$

since $K_{\alpha_1} \supseteq K_{\alpha_2} \supseteq \dots \supseteq K_{\alpha_l}$. However, $K_{\alpha_l} \subseteq K_1$ and $K_{\alpha_l} \neq \emptyset$. Thus, we have a contradiction. ■

Example 2.5.2. Consider $I_1 = [0, 1]$, and $I_2 = [0, \frac{1}{3}] \cup [\frac{2}{3}, 1]$, and picking I_3, I_4, \dots with same method, then $I_{n+1} \subseteq I_n$ for all n and they are compact, so

$$\bigcap_{i=1}^{\infty} I_i \neq \emptyset.$$

Theorem 2.5.5. Let (X, d) be a metric space.

- (a) If Y is a compact subset of X , and $Z \subseteq Y$, then Z is compact iff Z is closed.
- (b) If Y_1, \dots, Y_n are a finite collection of compact subsets of X , then $\bigcup_{i=1}^n Y_i$ are also compact.

proof of (a). If Z is compact, then by [Corollary 2.5.1](#), we know Z is closed. Now we show that if Z is closed, then Z is compact. If Z is closed, then $Y \setminus Z$ is open in Y , then we know

$$Y \setminus Z = V \cap Y$$

for some open set $V \subseteq Y$, so note that $(Y \setminus Z) \subseteq V$. Now suppose $\{U_\alpha\}_{\alpha \in A}$ is an open cover of Z . Hence, we know $\{U_\alpha\}_{\alpha \in A} \cup \{V\}$ is an open cover of Y since the former covers Z and the latter covers $Y \setminus Z$. Now since Y is compact, so we know for some $\alpha_1, \alpha_2, \dots, \alpha_n$, there is

$$Y \subseteq \left(\bigcup_{i=1}^n U_{\alpha_i} \right) \cup V,$$

and thus we can write

$$Z \subseteq Y \subseteq \left(\bigcup_{i=1}^n U_{\alpha_i} \right) \cup V.$$

However, note that $Z \cap V = \emptyset$ since

$$Z = Y \setminus (Y \setminus Z) = Y \setminus (V \cap Y) = (Y \setminus V) \cup (Y \setminus Y) = Y \setminus V.$$

Hence, we know

$$Z \subseteq \bigcup_{i=1}^n U_{\alpha_i},$$

and thus for any open cover of Z , we know there exists a finite subcover of Z , and we're done. ■

Chapter 3

Continuous functions on metric spaces

Suppose (X, d_X) and (Y, d_Y) are metric spaces. Let $f : X \rightarrow Y$ be a function from X to Y . Then we want that if $x \in X$ is close to $y \in X$, then, then $f(x) \in Y$ is close to $f(y) \in Y$.

Definition 3.0.1 (Continuous function). Let (X, d_X) and (Y, d_Y) be metric spaces and let $f : X \rightarrow Y$ be a function. Suppose $x_0 \in X$, we will say f is continuous at x_0 iff for every $\varepsilon > 0$, there exists $\delta > 0$ s.t.

$$d_Y(f(x), f(x_0)) < \varepsilon \quad \text{whereas } d_X(x, x_0) < \delta.$$

We say f is continuous if f is continuous at every point $x \in X$.

Definition 3.0.2 (Preimage). Let $f : X \rightarrow Y$ be a function from $X \rightarrow Y$ and $V \subseteq Y$. The preimage (inverse image) of V is

$$f^{-1}(V) = \{x \in X \mid f(x) \in V\} \subseteq X.$$

Example 3.0.1. Suppose $f(x) = x^2$, then what is the preimage of $(1, \infty)$?

Answer.

$$f^{-1}((1, \infty)) = (-\infty, -1) \cup (1, \infty).$$

⊛

Now we build an equivalent definition of continuity. If f is continuous at x_0 , then given any $\varepsilon > 0$, $\exists \delta > 0$ s.t.

$$f(x) \in B_Y(f(x_0), \varepsilon) \quad \text{whereas } x \in B_X(x_0, \delta).$$

Also, $f(x) \in B_Y(f(x_0), \varepsilon)$ if and only if

$$x \in f^{-1}(B_Y(f(x_0), \varepsilon)).$$

Hence, we have

Corollary 3.0.1. f is continuous at x_0 if and only if

$$\text{Given any } \varepsilon > 0, \exists \delta > 0 \text{ s.t. } B_X(x_0, \delta) \subseteq f^{-1}(B_Y(f(x_0), \varepsilon)).$$

Figure 3.1: Continuous function from (X, d_X) to (Y, d_Y)

Remark 3.0.1. If $f : X \rightarrow Y$ is continuous and $K \subseteq X$, then $f|_K : K \rightarrow Y$ is continuous.

Proof. Given any point $x_0 \in K \subseteq X$. Since f is continuous at x_0 , so $\forall \varepsilon > 0, \exists \delta > 0$ s.t.

$$d_Y(f(x), f(x_0)) < \varepsilon \quad \text{if } d_X(x, x_0) < \delta.$$

If $z \in K$ and $d_K(z, x_0) < \delta$, then $d_Y(f(z), f(x_0)) < \varepsilon$ since d_K is actually d_X but intersected to K , so f is continuous on K . \circledast

Theorem 3.0.1. Suppose that (X, d_X) and (Y, d_Y) be metric spaces, and $f : X \rightarrow Y$ is a function and let $x_0 \in X$, then TFAE:

- (a) f is continuous at x_0 .
- (b) Whenever $(x^{(n)})_{n=1}^{\infty}$ is a sequence in X converges to x_0 , then

$$\lim_{n \rightarrow \infty} f(x^{(n)}) = f(x_0) \text{ in } (Y, d_Y).$$

- (c) For every open set $V \subseteq Y$ that contains $f(x_0)$, \exists an open set $U \subseteq X$ containing x_0 s.t. $f(U) \subseteq V$, or equivalently, $U \subseteq f^{-1}(V)$.

proof of (a) \Rightarrow (b). Given any $\varepsilon > 0$, since f is continuous at x_0 , so $\exists \delta > 0$ s.t. if $d_X(x, x_0) < \delta$, then $d_Y(f(x), f(x_0)) < \varepsilon$. Now if $\lim_{n \rightarrow \infty} x^{(n)} = x_0$. Then there exists $N > 0$ s.t. $n \geq N$ implies $d_X(x^{(n)}, x_0) < \delta$. Hence, we know $d_Y(f(x^{(n)}), f(x_0)) < \varepsilon$. Hence, for this ε , we know there exists N s.t. $n \geq N$ implies $d_Y(f(x^{(n)}), f(x_0)) < \varepsilon$, and thus $\lim_{n \rightarrow \infty} f(x^{(n)}) = f(x_0)$. \blacksquare

proof of (b) \Rightarrow (c). Let $f(x_0) \in V \subseteq Y$ for some open V .

Claim 3.0.1. There exists an open set U s.t. $x_0 \in U \subseteq X$ and $f(U) \subseteq V$.

Proof. If this is not true, then this implies that for every open set U with $x_0 \in U$, consider $U_n = B_X(x_0, \frac{1}{n})$ for all n , then $\exists x_n \in U_n$ s.t. $f(x_n) \notin V$, then pick all of this x_n to be $\{x^{(n)}\}_{n=1}^\infty$ with $x^{(n)} \in U_n$ for all n , we know $\forall x^{(n)}$ we have $f(x^{(n)}) \notin V$. Then, $\{x^{(n)}\}_{n=1}^\infty$ is a sequence converges to x_0 . By (b), we know $\lim_{n \rightarrow \infty} f(x^{(n)}) = f(x_0) \in V$. However, by our choice, $f(x^{(n)}) \notin V$, so $f(x^{(n)}) \in Y \setminus V$. Since V is open, so $Y \setminus V$ is closed. Hence, we must have $\lim_{n \rightarrow \infty} f(x^{(n)}) = f(x_0) \in Y \setminus V$, which is a contradiction. \otimes

proof of (c) \Rightarrow (a). Suppose (c) holds, then we want to show f is continuous at x_0 , which means for all $\varepsilon > 0$, there exists $\delta > 0$ s.t. $B_X(x_0, \delta) \subseteq f^{-1}(B_Y(f(x_0), \varepsilon))$. Now consider $V = B_Y(f(x_0), \varepsilon) \subseteq Y$, then by (c) we know there exists open $U \subseteq X$ s.t. $x_0 \in U \subseteq f^{-1}(V)$. Now since U is open and $x_0 \in U$, so there exists $B_X(x_0, \delta) \subseteq U$, and thus

$$B_X(x_0, \delta) \subseteq U \subseteq f^{-1}(V) = f^{-1}(B_Y(f(x_0), \varepsilon)),$$

and we're done. \blacksquare

Theorem 3.0.2. Suppose $f : X \rightarrow Y$, then TFAE

- (a) f is continuous.
- (b) If $\lim_{n \rightarrow \infty} x^{(n)} = x \in (X, d_X)$, then $\lim_{n \rightarrow \infty} f(x^{(n)}) = f(x)$ in (Y, d_Y) .
- (c) If V is open in Y , then $f^{-1}(V)$ is open in X .
- (d) If F is closed in Y , then $f^{-1}(F)$ is closed in X .

Note 3.0.1. (a) says f is continuous, so it is a statement for every point in X and [Theorem 3.0.1](#) is a theorem for a single $x_0 \in X$.

(a) \Leftrightarrow (b). By [Theorem 3.0.1](#), we know it is true. \blacksquare

(c) holds iff for every $x \in X$, (c) in Theorem 3.0.1 holds. If we have (c) in [Theorem 3.0.1](#) holding for all $x \in X$ and we know V is open in Y , then for each $x \in f^{-1}(V)$, we have $f(x) \in V$, so there exists an open set u_x s.t. $x \in u_x \subseteq f^{-1}(V)$. Hence,

$$f^{-1}(V) = \bigcup_{x \in f^{-1}(V)} u_x.$$

Since u_x is open, so $f^{-1}(V)$ is open.

Now if we have (c), then

If V is open in Y , then $f^{-1}(V)$ is open in X .

Now for all open $V \subseteq Y$ that contains $f(x_0)$ for some $x_0 \in X$, we know $f(x_0) \in V$, so $x_0 \in f^{-1}(V)$, and since $f^{-1}(V)$ is open in X , so we can just pick $U = f^{-1}(V)$, and we're done since this proof is valid for all $x_0 \in X$. \blacksquare

(c) \Leftrightarrow (d). If F is closed in Y , then $Y \setminus F$ is open in Y , and thus $f^{-1}(Y \setminus F)$ is open in X , and since $f^{-1}(Y \setminus F) = X \setminus f^{-1}(F)$ is open, so $f^{-1}(F)$ is closed. This is the proof from (c) to (d), and the proof from (d) to (c) is similar. \blacksquare

Note 3.0.2. [Theorem 3.0.2](#) is a stronger version of [Theorem 3.0.1](#) since it states the version holding for all x .

Remark 3.0.2. [Theorem 3.0.2](#) tells us that continuity tells us if the image is open/closed, then the preimage is open/closed. However, if f is continuous, then the image of an open set on f may not be open, and the image of a closed set on f may not be closed.

Example 3.0.2. Consider $f(x) = x^2$, then $f(-1, 1) = [0, 1)$ is not open.

Example 3.0.3. Consider $f(x) = \arctan(x)$, then $f([0, \infty)) = [0, \frac{\pi}{2}]$.

Now if $f : X \rightarrow Y$ and $g : X \rightarrow Z$, then consider

$$(f, g) : X \rightarrow Y \times Z \text{ with } x \mapsto (f(x), g(x)),$$

we know $Y \times Z$ has a natural metric, which is defined as: If (y_1, z_1) and (y_2, z_2) are in $Y \times Z$, then

$$d_{Y \times Z}((y_1, z_1), (y_2, z_2)) = d_Y(y_1, y_2) + d_Z(z_1, z_2).$$

Lemma 3.0.1. Consider $f : X \rightarrow Y$ and $g : X \rightarrow Z$ and $(f, g) : X \rightarrow Y \times Z$, then f and g are both continuous if and only if (f, g) is continuous.

Proof. Suppose f, g are both continuous, then given $x \in X$, we know $\lim_{n \rightarrow \infty} x^{(n)} = x \in (X, d_X)$ implies

$$\lim_{n \rightarrow \infty} f(x^{(n)}) = f(x) \text{ and } \lim_{n \rightarrow \infty} g(x^{(n)}) = g(x).$$

Claim 3.0.2.

$$\lim_{n \rightarrow \infty} (f, g)(x^{(n)}) = (f, g)(x).$$

Proof. Check. ⊗

The other direction is also easy to prove. ■

Lecture 9

Corollary 3.0.2. Let (X, d_X) , (Y, d_Y) , and (Z, d_Z) be metric spaces.

30 Sep. 9:10

- (a) If $f : X \rightarrow Y$ is continuous at $x_0 \in X$, $g : Y \rightarrow Z$ is continuous at $f(x_0)$, then $g \circ f : X \rightarrow Z$ is continuous at x_0 .
- (b) If $f : X \rightarrow Y$ and $g : Y \rightarrow Z$ are continuous, then $g \circ f : X \rightarrow Z$ is continuous.

proof of (a). Fix $x_0 \in X$. Since f is continuous at x_0 , we have

$$\lim_{n \rightarrow \infty} x^{(n)} = x_0 \Rightarrow \lim_{n \rightarrow \infty} f(x^{(n)}) = f(x_0) \in Y.$$

Recall $(g \circ f)(x) = g(f(x))$. Since g is continuous at $f(x_0) \in Y$. It follows that

$$\lim_{n \rightarrow \infty} f(x^{(n)}) = f(x_0) \Rightarrow \lim_{n \rightarrow \infty} g(f(x^{(n)})) = g(f(x_0)).$$

Note that this means

$$\lim_{n \rightarrow \infty} f(x^{(n)}) = f(x_0) \Rightarrow \lim_{n \rightarrow \infty} (g \circ f)(x^{(n)}) = (g \circ f)(x_0).$$

Hence,

$$\lim_{n \rightarrow \infty} x^{(n)} = x_0 \Rightarrow \lim_{n \rightarrow \infty} (g \circ f)(x^{(n)}) = (g \circ f)(x_0),$$

which means $g \circ f$ is continuous at x_0 . ■

3.1 Continuity and Product Spaces

Given two functions $f : X \rightarrow Y$ and $g : X \rightarrow Z$, we can define the pairing $(f, g) : X \rightarrow Y \times Z$ by

$$(f, g)(x) = (f(x), g(x)).$$

Example 3.1.1. Suppose $f : \mathbb{R} \rightarrow \mathbb{R}$ is defined by $f(x) = x^2 + 3$ and $g : \mathbb{R} \rightarrow \mathbb{R}$ is defined by $g(x) = 4x$, then we can define $(f, g) : \mathbb{R} \rightarrow \mathbb{R} \times \mathbb{R}$ by

$$(f, g)(x) = (x^2 + 3, 4x).$$

Definition 3.1.1 (Product metric). Let (Y, d_Y) and (Z, d_Z) be metric spaces. Define a metric $d_{Y \times Z}^1$ on $Y \times Z$ by

$$d_{Y \times Z}^1((y_1, z_1), (y_2, z_2)) = d_Y(y_1, y_2) + d_Z(z_1, z_2).$$

Also, we can define $d_{Y \times Z}^\infty$ by

$$d_{Y \times Z}^\infty((y_1, z_1), (y_2, z_2)) = \max\{d_Y(y_1, y_2), d_Z(z_1, z_2)\}.$$

Finally, we can define

$$d_{Y \times Z}^2((y_1, z_1), (y_2, z_2)) = \sqrt{(d_Y(y_1, y_2))^2 + (d_Z(z_1, z_2))^2}.$$

Proposition 3.1.1. Let (Y, d_Y) and (Z, d_Z) be metric spaces, then $d_{Y \times Z}^1, d_{Y \times Z}^2, d_{Y \times Z}^\infty$ are metrics on $Y \times Z$.

Proof. Here we only prove $d_{Y \times Z}^1$ is a metric. For $(y_1, z_1), (y_2, z_2), (y_3, z_3)$ in $Y \times Z$.

- $d_{Y \times Z}^1((y_1, z_1), (y_2, z_2)) = d_Y(y_1, y_2) + d_Z(z_1, z_2) \geq 0$.
- If $d_{Y \times Z}^1((y_1, z_1), (y_2, z_2)) = 0$, then $y_1 = y_2 = z_1 = z_2 = 0$.
- $d_{Y \times Z}^1((y_1, z_1), (y_2, z_2)) = d_{Y \times Z}^1((y_2, z_2), (y_1, z_1))$.
-

$$\begin{aligned} d_{Y \times Z}^1((y_1, z_1), (y_3, z_3)) &= d_Y(y_1, y_3) + d_Z(z_1, z_3) \\ &\leq d_Y(y_1, y_2) + d_Y(y_2, y_3) + d_Z(z_1, z_2) + d_Z(z_2, z_3) \\ &= d_{Y \times Z}^1((y_1, z_1), (y_2, z_2)) + d_{Y \times Z}^1((y_2, z_2), (y_3, z_3)). \end{aligned}$$

■

Exercise 3.1.1. Show that $d_{Y \times Z}^2$ is a metric.

Proof. We only show the triangle inequality holds here. We use d instead of $d_{Y \times Z}^2$ here. For $(y_1, z_1), (y_2, z_2), (y_3, z_3)$ here, we have

$$\begin{aligned} d((y_1, z_1), (y_3, z_3))^2 &= d_Y(y_1, y_3)^2 + d_Z(z_1, z_3)^2 \leq (d_Y(y_1, y_2) + d_Y(y_2, y_3))^2 + (d_Z(z_1, z_2) + d_Z(z_2, z_3))^2 \\ &= d_Y(y_1, y_2)^2 + d_Y(y_2, y_3)^2 + d_Z(z_1, z_2)^2 + d_Z(z_2, z_3)^2 + 2(d_Y(y_1, y_2)d_Y(y_2, y_3) + d_Z(z_1, z_2)d_Z(z_2, z_3)) \\ &\leq d_Y(y_1, y_2)^2 + d_Y(y_2, y_3)^2 + d_Z(z_1, z_2)^2 + d_Z(z_2, z_3)^2 + 2\sqrt{d_Y(y_1, y_2)^2 + d_Z(z_1, z_2)^2}\sqrt{d_Y(y_2, y_3)^2 + d_Z(z_2, z_3)^2} \\ &= \left(\sqrt{d_Y(y_1, y_2)^2 + d_Z(z_1, z_2)^2} + \sqrt{d_Y(y_2, y_3)^2 + d_Z(z_2, z_3)^2}\right)^2 \\ &= (d((y_1, z_1), (y_2, z_2)) + d((y_2, z_2), (y_3, z_3)))^2. \end{aligned}$$

■

Proposition 3.1.2. $\lim_{n \rightarrow \infty} (y_n, z_n) = (y, z)$ in $Y \times Z$ w.r.t. d^1, d^2, d^∞ iff

$$\lim_{n \rightarrow \infty} y_n = y \text{ in } (Y, d_Y) \text{ and } \lim_{n \rightarrow \infty} z_n = z \text{ in } (Z, d_Z),$$

Proof. We prove the case w.r.t. $d_{Y \times Z}^\infty$ metric. Since

$$\lim_{n \rightarrow \infty} (y_n, z_n) = (y, z) \Leftrightarrow \lim_{n \rightarrow \infty} d_{Y \times Z}^\infty((y_n, z_n), (y, z)) = 0 \Leftrightarrow \lim_{n \rightarrow \infty} \max\{d_Y(y_n, y), d_Z(z_n, z)\} = 0.$$

Also,

$$\begin{aligned} 0 &\leq d_Y(y_n, y) \leq \max\{d_Y(y_n, y), d_Z(z_n, z)\} \\ 0 &\leq d_Z(z_n, z) \leq \max\{d_Y(y_n, y), d_Z(z_n, z)\}. \end{aligned}$$

Hence, by squeeze theorem, we must have $\lim_{n \rightarrow \infty} d_Y(y_n, y) = \lim_{n \rightarrow \infty} d_Z(z_n, z) = 0$.

If $\lim_{n \rightarrow \infty} d_Y(y_n, y) = 0$ and $\lim_{n \rightarrow \infty} d_Z(z_n, z) = 0$, then

$$\lim_{n \rightarrow \infty} d_{Y \times Z}^\infty((y_n, z_n), (y, z)) = \lim_{n \rightarrow \infty} \max\{d_Y(y_n, y), d_Z(z_n, z)\} = 0.$$

Hence, $\lim_{n \rightarrow \infty} (y_n, z_n) = (y, z)$ in $d_{Y \times Z}^\infty$ metrics. ■

Theorem 3.1.1. Let (Y, d_Y) and (Z, d_Z) be metric spaces. On $Y \times Z$, we have the metric d^1, d^2, d^∞ . The map $(f, g) : X \rightarrow Y \times Z$ is continuous iff $f : X \rightarrow Y$ and $g : X \rightarrow Z$ are both continuous.

Proof. If (f, g) is continuous. Take any sequence $x^{(n)}$ with $\lim_{n \rightarrow \infty} x^{(n)} = x$ in (X, d_X) . Then,

$$\lim_{n \rightarrow \infty} (f, g)(x^{(n)}) = (f, g)(x) \in Y \times Z.$$

Recall that $(f, g)(x^{(n)}) = (f(x^{(n)}), g(x^{(n)}))$. Hence, we have

$$\lim_{n \rightarrow \infty} f(x^{(n)}) = f(x) \in (Y, d_Y) \text{ and } \lim_{n \rightarrow \infty} g(x^{(n)}) = g(x) \in (Z, d_Z)$$

by [Proposition 3.1.2](#). Thus, f, g are both continuous at x . Since x can be arbitrary point in (X, d_X) , so f, g are both continuous. ■

Lemma 3.1.1. Let $f : X \rightarrow \mathbb{R}$ and $g : X \rightarrow \mathbb{R}$ be functions, and define $(f, g) : X \rightarrow \mathbb{R}^2$. We give \mathbb{R}^2 the Euclidean metric. Then, f, g are both continuous iff (f, g) is continuous.

Proof. By [Theorem 3.1.1](#). Choose d^2 on $\mathbb{R} \times \mathbb{R}$, then $d^2 = d_2 =$ Euclidean metric. ■

Lemma 3.1.2. The following functions are continuous.

- $(x, y) \mapsto x + y$ on \mathbb{R}^2
- $(x, y) \mapsto x - y$ on \mathbb{R}^2
- $(x, y) \mapsto x \cdot y$ on \mathbb{R}^2
- $(x, y) \mapsto \max\{x, y\}$ on \mathbb{R}^2
- $(x, y) \mapsto \frac{x}{y}$ on $\mathbb{R}^2 \setminus \{(x, 0) : x \in \mathbb{R}\}$.
- $x \mapsto cx$ on \mathbb{R} for any $c \in \mathbb{R}$.

Proof. We prove the $(x, y) \mapsto x \cdot y$ case. Define $M(x, y) = x \cdot y$. Choose $(x_0, y_0) \in \mathbb{R}^2$. Given $\varepsilon > 0$, we want to find $\delta > 0$ s.t.

$$d_2((x, y), (x_0, y_0)) = \sqrt{(x - x_0)^2 + (y - y_0)^2} < \delta \Rightarrow |M(x, y) - M(x_0, y_0)| < \varepsilon.$$

We will choose δ later. Now suppose we have chosen some appropriate δ , then we have $|x - x_0|, |y - y_0| < \delta$. Then,

$$|M(x, y) - M(x_0, y_0)| = |xy - x_0y_0| = |x(y - y_0) + y_0(x - x_0)|.$$

Now we choose some $\delta \leq 1$. Then since $|x - x_0| < \delta \leq 1$, we have

$$|x| = |x - x_0 + x_0| < |x - x_0| + |x_0| < 1 + |x_0|.$$

Thus, we have

$$\begin{aligned} |M(x, y) - M(x_0, y_0)| &\leq |x||y - y_0| + |y_0||x - x_0| \\ &< (1 + |x_0|)|y - y_0| + |y_0||x - x_0| \\ &< (1 + |x_0|)\delta + |y_0|\delta \\ &= (1 + |x_0| + |y_0|)\delta. \end{aligned}$$

Hence, we can choose

$$\delta = \min \left\{ 1, \frac{\varepsilon}{1 + |x_0| + |y_0|} \right\},$$

and we will have

$$|M(x, y) - M(x_0, y_0)| < \varepsilon \text{ whenever } d_2((x, y), (x_0, y_0)) < \delta.$$

■

Proof. Here we prove the $(x, y) \mapsto \max\{x, y\}$ case. Note that

$$\max\{x, y\} = \frac{x + y + |x - y|}{2}.$$

Then, we have

$$\begin{aligned} |\max\{x, y\} - \max\{a, b\}| &= \left| \frac{x + y + |x - y|}{2} - \frac{a + b + |a - b|}{2} \right| \\ &= \frac{1}{2} |(x - a) + (y - b) + |x - y| - |a - b|| \\ &\leq \frac{1}{2} (|x - a| + |y - b| + ||x - y| - |a - b||) \\ &\leq \frac{1}{2} (|x - a| + |y - b| + |(x - y) - (a - b)|) \\ &= \frac{1}{2} (|x - a| + |y - b| + |(x - a) + (b - y)|) \\ &\leq |x - a| + |b - y|. \end{aligned}$$

Note that if $d_2((x, y), (a, b)) < \delta$, then $|x - a| < \delta$ and $|y - b| < \delta$. Hence, for every $\varepsilon > 0$, we can just pick $\delta = \frac{\varepsilon}{2}$, and then we can show that

$$|\max\{x, y\} - \max\{a, b\}| < \varepsilon.$$

■

Corollary 3.1.1. Let (X, d) be a metric space, and let $f, g : X \rightarrow \mathbb{R}$ be functions. Let $c \in \mathbb{R}$. If f, g are continuous on X , then $f + g, f - g, f \cdot g, \max\{f, g\}, \min\{f, g\}, cf$ are continuous. Also, $\frac{f}{g}$ is also continuous at x_0 if $g(x_0) \neq 0$.

Proof. For example, we know

$$(f + g)(x) = \text{Add} \circ (f, g)(x) = \text{Add}(f(x), g(x)) = f(x) + g(x).$$

Since (f, g) is continuous and Add is continuous, so the composition function $\text{Add} \circ (f, g)$ is also

continuous. ■

3.2 Continuity and Compactness

Theorem 3.2.1. Let $f : X \rightarrow Y$ be a continuous function from (X, d_X) to (Y, d_Y) . Let $K \subseteq X$ be a compact subset of X . Then

$$f(K) = \{f(x) \mid x \in K\}$$

is also compact in Y .

Proof. Given any sequence $(y^{(n)})_{n=1}^\infty$ in $f(K)$, then $\exists x^{(n)} \in K$ s.t. $f(x^{(n)}) = y^{(n)}$. Since K is compact, then there exists a convergent subsequence $(x^{(n_k)})_{k=1}^\infty$ s.t. $\lim_{k \rightarrow \infty} x^{(n_k)} = x_* \in K$. Since f is continuous, so $\lim_{n \rightarrow \infty} f(x^{(n_k)}) = f(x_*)$ in Y . Hence, $\lim_{n \rightarrow \infty} y^{(n_k)} = f(x_*) \in f(K)$. Thus, $f(K)$ is compact. ■

Another method. Let $\{V_\alpha : \alpha \in A\}$ be any open cover of $f(K)$ i.e. $f(K) \subseteq \bigcup_{\alpha \in A} V_\alpha$ and V_α is open in Y . Hence,

$$K \subseteq \bigcup_{\alpha \in A} f^{-1}(V_\alpha).$$

Note that since f is continuous and V_α is open, so $f^{-1}(V_\alpha)$ is open by [Theorem 3.0.2](#). Hence, $\{f^{-1}(V_\alpha) : \alpha \in A\}$ is an open cover of K . Since K is compact, then

$$K \subseteq \bigcup_{i=1}^n f^{-1}(V_{\alpha_i})$$

Hence, $f(K) \subseteq \bigcup_{i=1}^n V_{\alpha_i}$, which shows $f(K)$ is compact. ■

Lecture 10

Proposition 3.2.1. Let (X, d) be a compact metric space and let $f : X \rightarrow \mathbb{R}$ be a continuous map. Then

2 Oct. 10:20

(1) f is bounded on X i.e. $f(X)$ is bounded in \mathbb{R} .

(2) $\exists x_{\max}, x_{\min} \in X$ s.t.

$$f(x_{\max}) = \max_{x \in X} f(x) \quad f(x_{\min}) = \min_{x \in X} f(x).$$

Proof. Since X is compact and f is continuous, so $f(X)$ is compact in \mathbb{R} and thus $f(X)$ is bounded by [Corollary 2.5.1](#). Now since $\{f(x) \mid x \in X\}$ is bounded in \mathbb{R} , so $\exists p_1, p_2$ s.t. $p_1 \leq f(x) \leq p_2$ for all $x \in X$. Let $M = \sup_{x \in X} f(x)$ and $P = \inf_{x \in X} f(x)$. Thus, there exists $\{y_n\}_{n=1}^\infty \subseteq f(X)$ s.t. $y_n \leq M$ and $\lim_{n \rightarrow \infty} y_n = M$ for all n . Hence, $\exists \{x^{(n)}\}_{n=1}^\infty$ s.t. $y_n = f(x^{(n)})$ for all n . Since X is compact, so there exists a subsequence $\{x^{(n_k)}\}_{k=1}^\infty$ s.t.

$$\lim_{k \rightarrow \infty} x^{(n_k)} = x_* \in X.$$

Since f is continuous, so $\lim_{k \rightarrow \infty} f(x^{(n_k)}) = f(x_*)$, which means $\lim_{k \rightarrow \infty} y_{n_k} = f(x_*)$. Since $\lim_{n \rightarrow \infty} y_n = M$, so $f(x_*) = M$, and thus $f(x_*) = \max_{x \in X} f(x)$.

Question. Why we can always find $\{y_n\}_{n=1}^\infty \subseteq f(X)$ converges to $M = \sup \{f(X)\}$?

Answer. Recall the definition of sup, we know $\forall \varepsilon > 0$, $M - \varepsilon < y_\varepsilon \leq M$ for some $y_\varepsilon \in f(X)$, so for all $\varepsilon = \frac{1}{N}$, we can pick all y_N to form a sequence converge to M . ⊗

Question. Why $\max_{x \in X} f(x) = \sup_{x \in X} f(x)$ here?

Answer. Since X is compact, so $x_* \in X$, which has been proved, and thus $M = f(x_*) \in f(X)$, which means $\sup_{x \in X} f(x) \in f(X)$. This is equivalent to $\sup_{x \in X} f(X) = \max_{x \in X} f(x)$. \circledast

Example 3.2.1. This proposition is false if X is not compact.

Proof. Consider $f : (0, 1) \rightarrow \mathbb{R}$ and $f(x) = x$, then f can't achieve its sup on $(0, 1)$.

Note 3.2.1. $(0, 1)$ is not compact since if it is compact, then it is closed, and thus all convergent sequence in $(0, 1)$ converging in $(0, 1)$, but consider the sequence $\{\frac{1}{n}\}_{n=2}^{\infty}$, and this sequence converges to $0 \notin (0, 1)$.

\circledast

3.3 Uniformly Continuous

Definition 3.3.1 (uniformly continuous). Let $f : X \rightarrow Y$ be a map between metric spaces (X, d_X) and (Y, d_Y) , we say f is uniformly continuous if $\forall \varepsilon > 0, \exists \delta > 0$ s.t.

$$d_Y(f(x), f(x')) < \varepsilon \text{ whenever } x, x' \in X \text{ and } d_X(x, x') < \delta.$$

Remark 3.3.1. This δ is independent of x' .

Example 3.3.1. $f(x) = \frac{1}{x}$ is continuous on $(0, 1]$, and f is not uniformly continuous on $(0, 1]$.

Proof. Let $\varepsilon = 10$. Suppose $\exists \delta > 0$ s.t.

$$|f(x) - f(y)| < \varepsilon \text{ if } |x - y| < \delta.$$

We may assume $\delta < 1$. Choose $x = \delta$ and $y = \frac{\delta}{11}$, then $|x - y| = \frac{10}{11}\delta < \delta$, and

$$|f(x) - f(y)| = \left| \frac{1}{\delta} - \frac{11}{\delta} \right| = \frac{10}{\delta} > 10.$$

\circledast

Theorem 3.3.1. Suppose X is compact, then $f : X \rightarrow Y$ is continuous iff f is uniformly continuous.

Proof. If f is uniformly continuous, then f is continuous. Now we show the other direction. If f is continuous, then by contradiction, if it is not uniformly continuous, then $\exists \varepsilon > 0$ s.t. no matter how small δ is, then $\exists p, q$ s.t. $d_X(p, q) < \delta$ and $d_Y(f(p), f(q)) \geq \varepsilon$. Choose $\delta = \frac{1}{n}$, then exists $p^{(n)}, q^{(n)} \in X$ s.t.

$$d_X(p^{(n)}, q^{(n)}) < \frac{1}{n} \text{ and } d_Y(f(p^{(n)}), f(q^{(n)})) \geq \varepsilon.$$

Since X is compact, so $\{p^{(n)}\}$ has a convergent subsequence, say

$$\lim_{k \rightarrow \infty} p^{(n_k)} = p \in X.$$

Also, there exists $\{q^{(n_k)}\}$ s.t. $\lim_{k \rightarrow \infty} q^{(n_k)} = p$ since $\lim_{k \rightarrow \infty} d_X(p^{(n_k)}, q^{(n_k)}) = 0$. (By [Theorem A.1.4](#)). Thus, we have

$$\lim_{k \rightarrow \infty} d_Y(f(p^{(n_k)}), f(q^{(n_k)})) = 0$$

since f is continuous. Hence, it is a contradiction, since

$$\lim_{n \rightarrow \infty} d_Y \left(f \left(p^{(n)} \right), f \left(q^{(n)} \right) \right) \geq \varepsilon.$$

■

3.4 Connectedness

Definition 3.4.1 (disconnected/connected). Let (X, d) be a metric space. We say X is disconnected iff \exists non-empty open V, W in X s.t. $V \cup W = X$ and $V \cap W = \emptyset$. Also, we called X is connected if it is non-empty and not disconnected.

Remark 3.4.1. X is disconnected iff X has a nonempty proper subset which is both open and closed.

Proof.

- (\Rightarrow) $V \cup W = X$ and $V \cap W = \emptyset$, so $X \setminus V = W$ is open, and thus V is closed. Since we already know V is open, so V is a proper subset of X that is clopen.
- (\Leftarrow) Suppose V is clopen in X and $V \neq X$. Let $W = X \setminus V \neq \emptyset$, then we know W is open since V is closed and thus $V \cup W = X$ and $V \cap W = \emptyset$ and V, W are both non-empty open in X , so X is disconnected.

■

Example 3.4.1. Suppose $X = [1, 2] \cup [3, 4]$, then X is disconnected.

Proof. Since

$$[1, 2] = (-\infty, 2.5) \cap X,$$

so $[1, 2]$ is open in X , and similarly we can show $[3, 4]$ is open in X , and $[1, 2] \cup [3, 4] = X$, and $[1, 2] \cap [3, 4] = \emptyset$, so X is disconnected. *

Definition 3.4.2. Let (X, d) be a metric space and $Y \subseteq X$. We say Y is connected (resp. disconnected) iff the metric space $(Y, d|_{Y \times Y})$ is connected (resp. connected).

Remark 3.4.2. $Y \subseteq X$ is disconnected iff $\exists U, V$ open in X s.t. $Y \subseteq U \cup V$ with $U \cap Y \neq \emptyset$ and $V \cap Y \neq \emptyset$ and $U \cap V \cap Y = \emptyset$.

Proof.

- (\Rightarrow) If Y is disconnected, then \exists open sets O_1, O_2 in Y s.t. $Y \subseteq O_1 \cup O_2$ and $O_1 \neq \emptyset$ and $O_2 \neq \emptyset$ and $O_1 \cap O_2 = \emptyset$. Since O_1 is open in Y , so there exists open set U_1 in X s.t. $O_1 = U_1 \cap Y \neq \emptyset$. Similarly, we know there exists U_2 open in X s.t. $O_2 = U_2 \cap Y \neq \emptyset$. Since

$$Y \subseteq O_1 \cup O_2 = (U_1 \cap Y) \cup (U_2 \cap Y) = (U_1 \cup U_2) \cap Y \subseteq U_1 \cup U_2,$$

and we know

$$\emptyset = O_1 \cap O_2 = (U_1 \cap Y) \cap (U_2 \cap Y) = U_1 \cap U_2 \cap Y.$$

- (\Leftarrow) Choose $O_1 = U \cap Y$ and $O_2 = V \cap Y$. Note that O_1, O_2 are non-empty and open in Y , and we can easily check that $O_1 \cup O_2 = Y$ and $O_1 \cap O_2 = \emptyset$, so Y is disconnected.

■

Figure 3.2: Disconnected set condition in Remark 3.4.2

Theorem 3.4.1. Let $f : X \rightarrow Y$ be a continuous map between metric spaces. Let E be any connected subset of X . Then $f(E)$ is connected in Y .

Proof. Suppose not, $f(E)$ is disconnected in Y , then \exists open set U, V in Y s.t. $f(E) \subseteq U \cup V$ and $U \cap f(E) \neq \emptyset$ and $V \cap f(E) \neq \emptyset$ and $U \cap V \cap f(E) = \emptyset$. Since f is continuous, so $f^{-1}(U)$ and $f^{-1}(V)$ are both open and non-empty and $(E \cap f^{-1}(U)) \cap (E \cap f^{-1}(V)) = \emptyset$, and note that $E \subseteq (E \cap f^{-1}(U)) \cup (E \cap f^{-1}(V))$, so E is disconnected.

Remark 3.4.3. $E \cap f^{-1}(U)$ and $E \cap f^{-1}(V)$ are open in E .

Theorem 3.4.2. Let X be a nonempty subset of \mathbb{R} , then TFAE:

- (a) X is connected.
- (b) Whenever $x, y \in X$ and $x < y$, we have $[x, y] \subseteq X$.
- (c) X is an interval.

proof from (a) to (b). Suppose not, then there exists $z \notin X$ s.t. $x < z < y$. Hence, we can pick $U = (-\infty, z) \cap X$ and $V = (z, \infty) \cap X$, then $U \neq \emptyset$ and $V \neq \emptyset$ and U, V both open in X and $U \cap V = \emptyset$ and $X \subseteq U \cup V$, so X is disconnected, which is a contradiction. ■

proof from (b) to (a). Suppose not, then X is disconnected, and thus there exists V, W open in X s.t. $X = V \cup W$ and $V \cap W = \emptyset$. Now fix $x \in V$ and $y \in W$. WLOG, suppose $x < y$, then $[x, y] \subseteq X = V \cup W$ by the hypothesis. Now suppose $S = [x, y] \cap V \subseteq X \subseteq \mathbb{R}$, then since $y \geq s$ for all $s \in S$, so S is a subset of \mathbb{R} which is bounded above, and thus $z = \sup S$ exists. Note that $z \leq y$, so $z \in [x, y] \subseteq X = V \cup W$.

- Case 1: $z \in V$, then $z < y$ since $y \in W$ and $V \cap W = \emptyset$. Now since V is open in X , so there exists $\varepsilon > 0$ s.t. $B_X(z, \varepsilon) \subseteq V$, which means $(z - \varepsilon, z + \varepsilon) \cap X \subseteq V$. In particular, we have $(z - \varepsilon, z + \varepsilon) \cap [x, y] \subseteq V$, and thus

$$(z, z + \varepsilon) \cap [x, y] \subseteq V \cap [x, y] = S.$$

Now since $z < y$, so $p \in (z, z + \varepsilon) \cap [x, y]$ for some p , which means $p \in S$. However, $p \in (z, z + \varepsilon)$ gives $p > z$, so S contains a $p > z = \sup S$, which is a contradiction.

- Case 2: $z \in W$, then there exists $\varepsilon > 0$ s.t. $B_X(z, \varepsilon) \subseteq W$ since W is open in X . Hence,

$$(z - \varepsilon, z + \varepsilon) \cap [x, y] \subseteq (z - \varepsilon, z + \varepsilon) \cap X \subseteq W.$$

Hence, we have $(z - \varepsilon, z + \varepsilon) \cap [x, y] \cap V = \emptyset$ since $V \cap W = \emptyset$. Note that this means $(z - \varepsilon, z + \varepsilon) \cap S = \emptyset$. However, we can construct a sequence of S converges to $\sup S$ (See [Theorem A.1.5](#)), so there exists $y \in S$ s.t. $y \in (z - \frac{\varepsilon}{2}, z + \frac{\varepsilon}{2}) \subseteq (z - \varepsilon, z + \varepsilon)$, which means $y \in (z - \varepsilon, z + \varepsilon) \cap S = \emptyset$, so it is a contradiction. ■

Remark 3.4.4. The fact that (b) is equivalent to (c) is trivial, so we don't give a proof.

Lecture 11

Theorem 3.4.3 (Review of [Theorem 3.4.1](#)). Let $f : X \rightarrow Y$ be a continuous map and let E be a connected subset of X . Then $f(E)$ is connected in Y .

7 Oct. 10:20

Corollary 3.4.1 (Intermediate value theorem). Let $f : X \rightarrow \mathbb{R}$ be a continuous map from (X, d_X) to \mathbb{R} . Let $E \subseteq X$ be any connected subset, and let $a, b \in E$. Suppose y is a real number between $f(a)$ and $f(b)$ i.e.

$$\min \{f(a), f(b)\} \leq y \leq \max \{f(a), f(b)\},$$

then $\exists c \in E$ s.t. $f(c) = y$.

Proof. There are 3 cases:

- Case 1: $f(a) = f(b)$, then trivial.
- Case 2: $f(a) < f(b)$, Since E is connected and f is continuous, so $f(E)$ is connected in \mathbb{R} . Hence, for $f(a), f(b) \in f(E)$, we know $(f(a), f(b)) \subseteq f(E)$ by [Theorem 3.4.2](#), so if $f(a) < y < f(b)$, then $\exists c \in E$ s.t. $f(c) = y$.
- Case 3: $f(a) > f(b)$, then let $a' = b$ and $b' = a$, then $f(a') < f(b')$ and use the result of Case 2. ■

3.5 Topological space

In metric space (X, d_X) , we define open ball

$$B_X(x, r) = \{y \mid d_X(y, x) < r\},$$

and a set u is open if for any $x \in u$, $\exists r_x > 0$ s.t. $B_X(x, r_x) \subseteq u$, so $u = \bigcup_{x \in u} B_X(x, r_x)$. Hence, in metric space open sets are in fact union of open balls. We also proved that

- \emptyset and X are open.
- If u_1, \dots, u_n are open in X , then $\bigcap_{i=1}^n u_i$ is open in X .
- If $\{u_i\}_{i \in A}$ are open in X , then $\bigcup_{i \in A} u_i$ is also open.

Now we want to extend this concept.

Definition 3.5.1 (Power sets). For a given set X , we define 2^X the power set of X i.e.

$$2^X := \{A : A \subseteq X\}$$

the collection of all subsets of X .

Example 3.5.1. $X = \{a, b\}$ for $a \neq b$, then

$$2^X = \{\emptyset, \{a\}, \{b\}, \{a, b\}\}.$$

Definition 3.5.2 (Topological space). A topological space is a pair (X, \mathcal{F}) , where X is a set and $\mathcal{F} \subseteq 2^X$ is a collection of subsets of X , called the open sets. The collection \mathcal{F} must satisfy

- \emptyset and X are all in \mathcal{F} .
- If u_1, \dots, u_n are in \mathcal{F} , then $\bigcap_{i=1}^n u_i$ is in \mathcal{F} .
- If $\{u_i\}_{i \in A}$ are in \mathcal{F} , then $\bigcup_{i \in A} u_i$ is in \mathcal{F} .

Remark 3.5.1. In a metric space, let

$$\mathcal{F} = \text{the set of open sets in } (X, d_X) = \{u \mid \forall x \in u, \exists r_x > 0 \text{ s.t. } B_X(x, r_x) \subseteq u\},$$

then (X, \mathcal{F}) is a topological space.

Example 3.5.2. On any set $X \neq \emptyset$, we have a trivial topology on X i.e. $\mathcal{F} = \{\emptyset, X\}$, which means (X, \mathcal{F}) is a topological space in X .

Example 3.5.3. Consider $\mathcal{F} = 2^X$, then $(X, 2^X)$ is also a topological space on X .

Definition 3.5.3 (Neighborhood). Let (X, \mathcal{F}) be a topological space, and let $x \in X$. A neighborhood of x is any open set $u \in \mathcal{F}$ s.t. $x \in u$.

Example 3.5.4. $X = \{a, b\}$ and $a \neq b$, $\mathcal{F} = \{\emptyset, \{a\}, \{b\}, \{a, b\}\}$, then $\{a\}, \{a, b\}$ are neighborhoods of a and $\{b\}, \{a, b\}$ are neighborhoods of b .

Definition 3.5.4 (Interior/Exterior/Boundary point). Let (X, \mathcal{F}) be a topological space, and $E \subseteq X$ be a subset. We say that

- x_0 is an interior point of E if \exists a neighborhood V of x_0 s.t. $V \subseteq E$.
- x_0 is an exterior point of E if \exists a neighborhood V of x_0 s.t. $V \subseteq X \setminus E$.
- x_0 is a boundary point if it is neither interior or exterior.

Corollary 3.5.1.

$$X = \text{Int}(E) \cup \text{Ext}(E) \cup \partial E.$$

Proof. ■

DIY

Definition 3.5.5 (Adherent point). We say x_0 is an adherent point of E if every neighborhood V of x_0 has a nonempty intersection with E , and we called \overline{E} the set of all adherent points.

Corollary 3.5.2. $\overline{E} = \text{Int}(E) \cup \partial E$.

Proof. We first show that $\text{Int}(E) \cup \partial E \subseteq \overline{E}$. Suppose $x_0 \in \text{Int}(E)$, then $x_0 \in E$, so $x_0 \in \overline{E}$ since $E \subseteq \overline{E}$. Now if $x_0 \in \partial E$, then any neighborhood V of x_0 contains points in E , so $x_0 \in \overline{E}$. Now we show that $\overline{E} \subseteq \text{Int}(E) \cup \partial E$. Since $\overline{E} \subseteq X = \text{Int}(E) \cup \text{Ext}(E) \cup \partial E$, so we want to show for all $x_0 \in \overline{E}$, we have $x_0 \notin \text{Ext}(E)$. By the definition of exterior point, we can easily show this. ■

Definition (Open and Closed Sets). Suppose (X, \mathcal{F}) is a topological space. Then:

- A set $O \subseteq X$ is called *open* if $O \in \mathcal{F}$.
- A set $F \subseteq X$ is called *closed* if its complement $X \setminus F$ is open, i.e., $X \setminus F \in \mathcal{F}$.

Corollary 3.5.3. A set $E \subseteq X$ is open if and only if $E = \text{Int}(E)$.

Proof.

(\Rightarrow) If E is open, then since

$$\text{Int}(E) = \bigcup \{O \subseteq E : O \in \mathcal{F}\}, \quad (3.1)$$

we know $E \subseteq \text{Int}(E)$.

(\Leftarrow) By the definition of topological space and Equation 3.1, we know $\text{Int}(E)$ is open, so $E = \text{Int}(E)$ implies E is open. ■

Corollary 3.5.4. A set $F \subseteq X$ is closed if and only if $\overline{F} = F$.

Proof. If F is closed, then $X \setminus F$ is open, so $X \setminus F = \text{Int}(X \setminus F)$, so

$$F = X \setminus (X \setminus F) = X \setminus \text{Int}(X \setminus F) = X \setminus \text{Ext}(F) = \text{Int}(F) \cup \partial(F) = \overline{F}.$$

The other direction is similar. ■

Definition 3.5.6 (Topological subspace). Let (X, \mathcal{F}) be a topological space and $Y \subseteq X$. We define $\mathcal{F}_Y = \{V \cap Y \mid V \in \mathcal{F}\}$ and call (Y, \mathcal{F}_Y) the topological subspace of (X, \mathcal{F}) induced by Y . We can show that \mathcal{F}_Y is a topology on Y .

Definition 3.5.7 (Continuous map). Let (X, \mathcal{F}) and (Y, g) be topological spaces and let $f : X \rightarrow Y$ be a function. We say f is continuous at $x_0 \in X$ if for every neighborhood $V \in g$ of $f(x_0)$, there exists a neighborhood $u \in \mathcal{F}$ of x_0 s.t. $u \subseteq f^{-1}(V)$.

Definition 3.5.8 (Convergence). Let m be an integer, (X, \mathcal{F}) be a topological space, and let $(x^{(n)})_{n=m}^{\infty}$ be a sequence of points in X . We say $x^{(n)} \rightarrow x$ iff for every neighborhood V of x , $\exists N \geq m$ s.t. $x^{(n)} \in V$ for all $n \geq N$.

Remark 3.5.2. In a topological space, a sequence may converge to more than one points.

Example 3.5.5. Let $X = \{a, b\}$ and $a \neq b$. Consider the trivial topology $\mathcal{F} = \{\emptyset, X\}$. If we have the constant sequence $\{x^{(n)}\}_{n=m}^{\infty}$ with $x^{(n)} = a$, then $\lim_{n \rightarrow \infty} x^{(n)} = a$ and $\lim_{n \rightarrow \infty} x^{(n)} = b$.

Proof. Any neighborhood of a must be $\{a, b\}$, and any neighborhood of b must also be $\{a, b\}$, so $\lim_{n \rightarrow \infty} x^{(n)} = a$ and $\lim_{n \rightarrow \infty} x^{(n)} = b$. (⊛)

Example 3.5.6. On \mathbb{R} , we consider

$$\mathcal{F} = \{\emptyset\} \cup \{u : \mathbb{R} \setminus u \text{ is finite points}\},$$

then \mathcal{F} is a topology on \mathbb{R} .

Proof. Since $\emptyset, \mathbb{R} \in \mathcal{F}$, so it satisfies the first rule of topology. Now if $u_1 \in \mathcal{F}$ and $u_2 \in \mathcal{F}$, then we want to show $u_1 \cap u_2 \in \mathcal{F}$. We assume u_1, u_2 are non-empty, otherwise it is trivial. Consider $\mathbb{R} \setminus (u_1 \cap u_2) = (\mathbb{R} \setminus u_1) \cup (\mathbb{R} \setminus u_2)$, since $\mathbb{R} \setminus u_1$ and $\mathbb{R} \setminus u_2$ are both finite points, so $u_1 \cap u_2$ is finite points. Hence, we know for finitely many u_1, \dots, u_n , $\bigcap_{i=1}^n u_i$ is in \mathcal{F} . Now we know for $\mathcal{F}_\alpha \in \mathcal{F}$,

$$\mathbb{R} \setminus \left(\bigcup_{\alpha} \mathcal{F}_{\alpha} \right) = \bigcap_{\alpha} (\mathbb{R} \setminus \mathcal{F}_{\alpha}) \subseteq \mathbb{R} \setminus \mathcal{F}_{\alpha_i}$$

for some α_i in the index set, so $\mathbb{R} \setminus (\bigcup_{\alpha} \mathcal{F}_{\alpha})$ is also finite points, and we're done. \circledast

Remark 3.5.3. In the topological space induced by the topology in [Example 3.5.6](#). If we consider $\{x^{(n)}\}_{n=1}^{\infty}$ with $x^{(n)} = n$, then $\lim_{n \rightarrow \infty} x^{(n)} = p$ for any $p \in \mathbb{R}$.

Proof. Since any neighborhood u of p has

$$\mathbb{R} \setminus u = \{p_1, \dots, p_k\}$$

with $p_1 < p_2 < \dots < p_k$, so we have $x^{(n)} \in u$ for $n > p_k$. \blacksquare

Lecture 12

Last time, we show that the sequence $\{x_n\}_{n=1}^{\infty}$ with $x_n = n$ converges to any point p in \mathbb{R} in cofinite topology i.e. 9 Oct. 10:20

$$\mathcal{F} = \{\emptyset\} \cup \{\mathbb{R} \setminus \{\text{finite points}\}\}$$

because each non-empty neighborhood of p is very big. In general, a sequence in a topological space may converge to more than one points.

Definition 3.5.9 (Hausdorff). A topological space (X, \mathcal{F}) is called Hausdorff if given any two distinct points $x, y \in X$, there exists open sets $U, V \in \mathcal{F}$ s.t. $x \in U$ and $y \in V$ and $U \cap V = \emptyset$.

Example 3.5.7. A metric space is Hausdorff since given $x \neq y$, $B_X(x, \frac{r}{2})$ and $B_X(y, \frac{r}{2})$ are open and they separate x and y where $r = \frac{d(x, y)}{2}$.

Theorem 3.5.1. Suppose (X, \mathcal{F}) is a Hausdorff topological space, then the limit of a convergent sequence is unique.

Proof. If $\lim_{n \rightarrow \infty} x_n = x$ and $\lim_{n \rightarrow \infty} x_n = y$ for some $x \neq y$, then since (X, \mathcal{F}) is Hausdorff, so there exists neighborhood U of x and V of y and $U \cap V = \emptyset$. Also, there exists $N_1 > 0$ s.t. $x_n \in U$ if $n \geq N_1$, and there exists $N_2 > 0$ s.t. $x_n \in V$ if $n \geq N_2$. Hence, for all $n \geq \max\{N_1, N_2\}$, we know $x_n \in U \cap V = \emptyset$, which is a contradiction. Hence, the limit of a convergence sequence is unique. \blacksquare

Definition 3.5.10 (Compact). Let (X, \mathcal{F}) be topological space, we say X is compact if for every open cover

$$\{U_{\alpha} : \alpha \in A\} \subseteq \mathcal{F} \text{ with } X \subseteq \bigcup_{\alpha \in A} U_{\alpha},$$

there exists a finite subcover $\{U_{\alpha_1}, U_{\alpha_2}, \dots, U_{\alpha_n}\}$ s.t.

$$X \subseteq \bigcup_{i=1}^n U_{\alpha_i}.$$

Theorem 3.5.2. Let $f : (X, \mathcal{F}) \rightarrow (Y, \mathcal{G})$ be a continuous map between topological spaces. If $K \subseteq X$ is compact, then $f(K)$ is also compact in (Y, \mathcal{G}) .

Proof. Let $\{V_\alpha\}_{\alpha \in A}$ be an open cover of $f(K)$ i.e. $\{V_\alpha\}_{\alpha \in A} \subseteq \mathcal{G}$ and $f(K) \subseteq \bigcup_{\alpha \in A} V_\alpha$. Since f is continuous, so $f^{-1}(V_\alpha) \in \mathcal{F}$ and

$$K \subseteq \bigcup_{\alpha \in A} f^{-1}(V_\alpha).$$

Now since K is compact, so there exists finite subcover, which means $K \subseteq \bigcup_{i=1}^n f^{-1}(V_{\alpha_i})$, so $f(K) \subseteq \bigcup_{i=1}^n V_{\alpha_i}$, and thus $f(K)$ has a finite subcover of $\{V_\alpha\}_{\alpha \in A}$, which means $f(K)$ is compact.

Remark 3.5.4. In topological space, we also have: $f : X \rightarrow Y$ is continuous if and only if whenever $V \subseteq Y$ is open (resp. closed), we have $f^{-1}(V)$ is open (resp. closed) in X .

Proof. ■

DIY

Proposition 3.5.1. Let (X, \mathcal{F}) be a compact topological space and $f : X \rightarrow \mathbb{R}$ is continuous, then

- (1) f is bounded on X .
- (2) If $X \neq \emptyset$, then $\exists x_{\min}, x_{\max} \in X$ s.t. $f(x_{\max}) = \max_{x \in X} f(x)$ and $f(x_{\min}) = \min_{x \in X} f(x)$.

Proof.

- (1) Since X is compact, so $f(X)$ is compact in \mathbb{R} by [Theorem 3.5.2](#), and since \mathbb{R} is a metric space, so $f(X)$ is closed and bounded in \mathbb{R} , which means f is bounded on X .
- (2) Now since $f(X)$ is bounded, so $\sup_{x \in X} f(x)$ and $\inf_{x \in X} f(x)$ exists. Thus, we can pick $(y_n) \in f(X)$ and $(z_n) \in f(X)$ s.t. $y_n \rightarrow \sup_{x \in X} f(x)$ and $z_n \rightarrow \inf_{x \in X} f(x)$ by [Theorem A.1.5](#). Now since $f(X)$ is closed, so

$$\sup_{x \in X} f(x) \in \overline{f(X)} = f(X),$$

so there exists x^* s.t. $f(x^*) = \sup_{x \in X} f(x)$ and similarly the "min" case can be proved. ■

Chapter 4

Uniform Convergence

In a metric space (X, d) , we define the convergence of a sequence $\{x^{(n)}\}_{n=m}^{\infty}$, $\lim_{n \rightarrow \infty} x^{(n)} = x$, by "Given any $\varepsilon > 0$, $\exists N \geq m$ s.t. $d(x^{(n)}, x) < \varepsilon$ for all $n \geq N$ ". Now suppose

$$f^{(n)} : X \rightarrow Y \quad \forall n \in \mathbb{N},$$

where X, Y are metric spaces, then if we define the convergence of these functions at some point x to be:

$$f(x) = \lim_{n \rightarrow \infty} f^{(n)}(x).$$

Do we have

$$\lim_{n \rightarrow \infty} \lim_{x \rightarrow x_0} f^{(n)}(x) = \lim_{x \rightarrow x_0} \lim_{n \rightarrow \infty} f^{(n)}(x)?$$

Short answer: Not always true.

In this chapter, we will discuss the concept of limiting function, that is,

$$\lim_{n \rightarrow \infty} f^{(n)} = f.$$

4.1 Limiting values of functions

Definition 4.1.1. Let (X, d_X) and (Y, d_Y) be metric spaces, and let $E \subseteq X$ and $f : E \rightarrow Y$ be a function. If $x_0 \in X$ is an adherent point of E , and $L \in Y$, we say that

$$\lim_{x \rightarrow x_0, x \in E} f(x) = L$$

if for every $\varepsilon > 0$, $\exists \delta > 0$ s.t. $d_X(x, x_0) < \delta$ and $x \in E$ implies $d_Y(f(x), L) < \varepsilon$.

Remark 4.1.1. In this definition, we need not $x_0 \in E$, we just need $x_0 \in \overline{E}$.

Remark 4.1.2. In other textbook, if

$$f(x) = \begin{cases} |x|, & \text{if } x \neq 0; \\ 1, & \text{if } x = 0, \end{cases}$$

then $\lim_{x \rightarrow 0} f(x) = 0$ because it does not consider $x = 0$. More precisely, the definition of

$$\lim_{x \rightarrow x_0, x \in E} f(x) = L$$

in other textbook is " $\forall \varepsilon > 0$, $\exists \delta > 0$ s.t. $d_Y(f(x), L) < \varepsilon$ for all $x \in E$ and $0 < d_X(x, x_0) < \delta$ ". Note that it exclude the case $x = x_0$.

However, if $x_0 \in E$, then by Terrence Tao's definition, $\lim_{x \rightarrow x_0, x \in E} f(x) = L$ if $d_Y(f(x), L) < \varepsilon$ for all $\varepsilon > 0$ and for $x \in E$ s.t. $d_X(x, x_0) < \delta$ for the corresponding δ . Also, if $x_0 \notin E$, then since

$x_0 \in \overline{E}$, so $\exists x \in E$ s.t. $d(x, x_0) < \delta$, so the definition of $\lim_{x \rightarrow x_0, x \in E} f(x)$ is well-defined. In our notation, other textbooks' definition is like

$$\lim_{x \rightarrow x_0, x \in E \setminus \{x_0\}} f(x) = L.$$

Lemma 4.1.1. If (X, d_X) and (Y, d_Y) are metric spaces, then $f : X \rightarrow Y$ is continuous at $x_0 \in X$ is in fact

$$\lim_{x \rightarrow x_0, x \in X} f(x) = f(x_0).$$

Proof. Since f is continuous at x_0 means for all $(x_n) \rightarrow x_0$, we have $f(x_n) \rightarrow f(x_0)$, so this is true. ■

Proposition 4.1.1. Let (X, d_X) and (Y, d_Y) be metric spaces, and $f : X \rightarrow Y$ be a function. Let $x_0 \in X$ be an adherent point of $E \subseteq X$ and $L \in Y$, then TFAE:

- (a) $\lim_{x \rightarrow x_0, x \in E} f(x) = L$.
- (b) For every sequence $\{x^{(n)}\}_{n=1}^{\infty}$ in E converges to x_0 , the sequence $\lim_{n \rightarrow \infty} f(x^{(n)}) = L$ in Y .
- (c) For every open set $V \subseteq Y$ containing L , there exists an open set $U \subseteq X$ containing x_0 s.t. $U \cap E \subseteq f^{-1}(V)$.
- (d) If one define $g : E \cup \{x_0\} \rightarrow Y$ by

$$g(x) = \begin{cases} f(x), & \text{if } x \in E \setminus \{x_0\}; \\ L, & \text{if } x = x_0, \end{cases}$$

then g is continuous at x_0 on E .

proof from (a) to (b). We know for all $\varepsilon > 0$, there exists $\delta > 0$ s.t. $x \in E$ and $d_X(x, x_0) < \delta$ implies $d_Y(f(x), L) < \varepsilon$. Also, if we have a sequence $\{x^{(n)}\}_{n=1}^{\infty} \subseteq E$ converges to x_0 , then there exists $N > 0$ s.t. $n \geq N$ implies $d_X(x^{(n)}, x_0) < \delta$, so for all $n \geq N$, we know $d_Y(f(x^{(n)}), L) < \varepsilon$. ■

proof from (b) to (c). Suppose by contradiction, $V \subseteq Y$ is an open neighborhood of L , and there does not exist an open neighborhood $U \subseteq X$ of x_0 has

$$U \cap E \subseteq f^{-1}(V),$$

then for all $n \in \mathbb{N}$, we know $\exists y_n \in B_X(x_0, \frac{1}{n}) \cap E$ and $y_n \notin f^{-1}(V)$, and note that $(y_n)_{n=1}^{\infty}$ is a sequence converges to x_0 in E , so by (b) we know $(f(y_n))_{n=1}^{\infty}$ must converges to L , which means for the neighborhood V of L , there exists $N > 0$ s.t. $n \geq N$ implies $f(y_n) \in V$. ■

proof from (c) to (d). ■

proof from (d) to (a). ■

4.2 Pointwise and Uniform Convergence

Definition 4.2.1 (Pointwise convergence). Let $(f^{(n)})_{n=1}^{\infty}$ be a sequence of functions from (X, d_X) to (Y, d_Y) , and let $f : X \rightarrow Y$ be another function. We say that $f^{(n)}$ converges pointwise to f on X if for every $x \in X$ and every $\varepsilon > 0$, $\exists N_x > 0$ s.t.

$$d_Y(f^{(n)}(x), f(x)) < \varepsilon \quad \forall n \geq N_x.$$

Definition 4.2.2 (Uniformly convergence). We say $f^{(n)}$ converges uniformly to f on X if for every $\varepsilon > 0$, $\exists N > 0$ s.t.

$$d_Y \left(f^{(n)}(x), f(x) \right) < \varepsilon$$

for all $n \geq N$ and all $x \in X$. (N is independent of x)

Example 4.2.1. Suppose $f_n(x) = \frac{x}{n}$, then $f_n \rightarrow 0$ pointwise (0 is the zero function here). However, $\{f^{(n)}\}$ is not uniformly convergent since given $\varepsilon = 1$, if $\exists N > 0$ s.t.

$$|f_n(x) - 0| < 1$$

for all $n \geq N$ and $x \in \mathbb{R}$, then

$$\left| \frac{x}{n} \right| < 1$$

for all $n \geq N$ and $x \in X$, but if we pick $n = N$ and $x = 2N$, then it gives a contradiction.

Example 4.2.2. $f_n(x) = x^n$ on $[0, 1]$, then we know

$$\lim_{n \rightarrow \infty} f_n(x) = \begin{cases} 0, & \text{if } 0 \leq x < 1; \\ 1, & \text{if } x = 1, \end{cases}$$

so f_n continuous and pointwise convergent but not uniformly convergent.

Example 4.2.3. Suppose $f_n(x) = \frac{x}{n}$ on $[0, 1]$, then $\lim_{n \rightarrow \infty} f_n(x) = 0$ uniformly.

Proof.

■

DIY

Example 4.2.4. Consider

$$f_n(x) = \begin{cases} 2n, & \text{if } x \in \left[\frac{1}{2n}, \frac{1}{n} \right]; \\ 0, & \text{if } x \in \mathbb{R} \setminus \left[\frac{1}{2n}, \frac{1}{n} \right], \end{cases}$$

then $\lim_{n \rightarrow \infty} f_n(x) = 0$ pointwisely, but if we integrate on both side, then

$$\int_0^1 f^{(n)}(x) dx = 2n \left(\frac{1}{n} - \frac{1}{2n} \right) = 2n \cdot \frac{1}{2n} = 1,$$

but $\int_0^1 0 dx = 0$, so we know pointwise convergence will not implies they will be equal after integration.

Remark 4.2.1. We will learn that uniform convergence can ensure integration after taking limit takes same value of taking limit after integration.

Lecture 13

As previously seen. $\lim_{n \rightarrow \infty} f_n = f$ uniformly where $f_n, f : X \rightarrow Y$ iff given any $\varepsilon > 0$, $\exists N > 0$ s.t.

14 Oct. 9:10

$$d_Y(f_n(x), f(x)) < \varepsilon \quad \forall x \in X \text{ and } n \geq N.$$

Theorem 4.2.1 (考試會考). Suppose $(f^{(n)})_{n=1}^{\infty}$ is a sequence of functions from one metric space (X, d_X) to (Y, d_Y) and suppose this sequence of functions converge uniformly to another function

$f : X \rightarrow Y$. Let $x_0 \in X$. If each $f^{(n)}$ is continuous at x_0 , then f is continuous at x_0 .

Proof. Since $f_n \rightarrow f$ uniformly. Given $\varepsilon > 0$, $\exists N > 0$ s.t.

$$d_Y \left(f^{(n)}(x), f(x) \right) < \frac{\varepsilon}{3} \quad \text{for all } x \in X, n \geq N.$$

Since $f^{(N)}$ is continuous at x_0 , so there exists $\exists \delta > 0$ s.t. if $d_X(x, x_0) < \delta$, then

$$d_Y \left(f^{(N)}(x), f^{(N)}(x_0) \right) < \frac{\varepsilon}{3}.$$

Now if $d_X(x, x_0) < \delta$, then

$$\begin{aligned} d_Y(f(x), f(x_0)) &\leq d_Y \left(f(x), f^{(N)}(x) \right) + d_Y \left(f^{(N)}(x), f^{(N)}(x_0) \right) + d_Y \left(f^{(N)}(x_0), f(x_0) \right) \\ &< \frac{\varepsilon}{3} + \frac{\varepsilon}{3} + \frac{\varepsilon}{3} = \varepsilon. \end{aligned}$$

Hence, f is continuous at x_0 . ■

Corollary 4.2.1. Let $f^{(n)}, f : X \rightarrow Y$. Suppose $f^{(n)} : X \rightarrow Y$ are continuous for all n . If $\lim_{n \rightarrow \infty} f^{(n)} = f$ uniformly, then f is also continuous.

Example 4.2.5. Suppose $f_n(x) = x^n$ define on $[0, 1]$ for all $n \in \mathbb{N}$, then we know

$$\lim_{n \rightarrow \infty} f_n(x) = \begin{cases} 0, & \text{if } 0 \leq x < 1; \\ 1, & \text{if } x = 1. \end{cases}$$

Now suppose

$$f(x) = \begin{cases} 0, & \text{if } 0 \leq x < 1; \\ 1, & \text{if } x = 1. \end{cases},$$

then $\lim_{n \rightarrow \infty} f_n(x) = f(x)$ pointwise. Note that $f_n = x^n$ is continuous on $[0, 1]$ but f is not continuous. Hence, f_n does not converge uniformly to f .

Remark 4.2.2. This example tells us if we change converge uniformly to converge pointwise in [Theorem 4.2.1](#), then it may not be true.

Now we want to know is

$$\lim_{n \rightarrow \infty} \lim_{x \rightarrow x_0, x \in E} f^{(n)}(x) = \lim_{x \rightarrow x_0, x \in E} \lim_{n \rightarrow \infty} f^{(n)}(x)?$$

We will later show that the equality holds if $f^{(n)} \rightarrow f$ uniformly and Y complete, where we define $f^{(n)}, f : X \rightarrow Y$.

Proposition 4.2.1. Let (X, d_X) and (Y, d_Y) be metric spaces with Y complete, and let $E \subseteq X$. Suppose $(f^{(n)})_{n=1}^{\infty}$ is a sequence of functions from E to Y that converges uniformly to some function $f : E \rightarrow Y$. Let $x_0 \in X$ be adherent point of E , and suppose that for each n , $\lim_{x \rightarrow x_0, x \in E} f^{(n)}(x)$ exists. Then the limit $\lim_{x \rightarrow x_0, x \in E} f(x)$ also exists, and moreover,

$$\lim_{n \rightarrow \infty} \lim_{x \rightarrow x_0, x \in E} f^{(n)}(x) = \lim_{x \rightarrow x_0, x \in E} \lim_{n \rightarrow \infty} f^{(n)}(x).$$

Proof. Since $\lim_{x \rightarrow x_0, x \in E} f^{(n)}(x)$ exists, so we can let $L_n := \lim_{x \rightarrow x_0, x \in E} f^{(n)}(x) \in Y$. First, we show that $\{L_n\}_{n=1}^{\infty}$ is Cauchy. Since $\lim_{n \rightarrow \infty} f^{(n)} = f$ uniformly on E . Given $\varepsilon > 0$, $\exists N > 0$ s.t.

$$d_Y \left(f^{(n)}(x), f(x) \right) < \frac{\varepsilon}{6} \quad \text{for all } x \in E, n \geq N.$$

Hence, $n, m \geq N$ implies

$$d_Y \left(f^{(n)}(x), f^{(m)}(x) \right) \leq d_Y \left(f^{(n)}(x), f(x) \right) + d_Y \left(f(x), f^{(m)}(x) \right) < \frac{\varepsilon}{6} + \frac{\varepsilon}{6} = \frac{\varepsilon}{3}.$$

Now since $\lim_{x \rightarrow x_0, x \in E} f^{(n)}(x) = L_n$ and $\lim_{x \rightarrow x_0, x \in E} f^{(m)}(x) = L_m$, so there exists $\delta_n, \delta_m > 0$ s.t. for all $x \in E$,

$$\begin{aligned} d(x, x_0) < \delta_n &\Rightarrow d_Y \left(f^{(n)}(x), L_n \right) < \frac{\varepsilon}{3} \\ d(x, x_0) < \delta_m &\Rightarrow d_Y \left(f^{(m)}(x), L_m \right) < \frac{\varepsilon}{3}. \end{aligned}$$

Choose $\delta = \min \{\delta_n, \delta_m\}$ and fix $x \in E$ with $d_X(x, x_0) < \delta$ (since $x_0 \in \overline{E}$ so this is possible), then

$$d_Y(L_n, L_m) \leq d_Y(L_n, f^{(n)}(x)) + d_Y(f^{(n)}(x), f^{(m)}(x)) + d_Y(f^{(m)}(x), L_m) < \frac{\varepsilon}{3} + \frac{\varepsilon}{3} + \frac{\varepsilon}{3} = \varepsilon.$$

Hence, $\{L_n\}_{n=1}^\infty$ is Cauchy. Since Y is complete, so $\lim_{n \rightarrow \infty} L_n = L$ for some $L \in Y$.

Claim 4.2.1. $\lim_{x \rightarrow x_0, x \in E} f(x) = L$.

Proof. Fix $\varepsilon > 0$, then $\lim_{n \rightarrow \infty} L_n = L$ and $\lim_{n \rightarrow \infty} f^{(n)}(x) = f(x)$ uniformly on E , so there exists $N > 0$ s.t.

$$d_Y(L_n, L) < \frac{\varepsilon}{3} \text{ and } d_Y(f^{(n)}(x), f(x)) < \frac{\varepsilon}{3} \text{ for all } x \in E, n \geq N.$$

Now since $L_n = \lim_{x \rightarrow x_0, x \in E} f^{(n)}(x)$, so there exists $\delta > 0$ s.t. for all $x \in E$ and for all n ,

$$d_X(x, x_0) < \delta \Rightarrow d_Y(f^{(n)}(x), L_n) < \frac{\varepsilon}{3}.$$

For this δ , if $d_X(x, x_0) < \delta$ and $x \in E$, then we know

$$d_Y(f(x), L) \leq d_Y(f(x), f^{(N)}(x)) + d_Y(f^{(N)}(x), L_N) + d_Y(L_N, L) < \varepsilon.$$

⊛

Hence,

$$\begin{aligned} \lim_{n \rightarrow \infty} \lim_{x \rightarrow x_0, x \in E} f^{(n)}(x) &= \lim_{n \rightarrow \infty} L_n = L \\ \lim_{x \rightarrow x_0, x \in E} \lim_{n \rightarrow \infty} f^{(n)}(x) &= \lim_{x \rightarrow x_0, x \in E} f(x) = L. \end{aligned}$$

This means $\lim_{x \rightarrow x_0, x \in E}$ and $\lim_{n \rightarrow \infty}$ is exchangeable here. ■

Proposition 4.2.2. Let $f^{(n)} : X \rightarrow Y$ be a sequence of continuous functions. If $\lim_{n \rightarrow \infty} f^{(n)} = f$ uniformly. Let $\lim_{n \rightarrow \infty} x^{(n)} = x$ in X , then $\lim_{n \rightarrow \infty} f^{(n)}(x^{(n)}) = f(x)$.

Proof. Since $f^{(n)} \rightarrow f$ uniformly, so given $\varepsilon > 0$, there exists $N_1 > 0$ s.t.

$$d_Y(f^{(n)}(x), f(x)) < \frac{\varepsilon}{2} \text{ for all } x \in X, n \geq N_1.$$

Since $f^{(n)} \rightarrow f$ uniformly, so f is also continuous by [Corollary 4.2.1](#), so there exists $\delta_x > 0$ s.t.

$$d_X(y, x) < \delta_x \Rightarrow d_Y(f(y), f(x)) < \frac{\varepsilon}{2}.$$

Since $\lim_{n \rightarrow \infty} x^{(n)} = x$, so there exists $N_2 > 0$ s.t. $d_X(x^{(n)}, x) < \delta_x$ for all $n \geq N_2$. Let

$N = \max \{N_1, N_2\}$, then $n \geq N$ implies

$$d_Y \left(f^{(n)} \left(x^{(n)} \right), f(x) \right) \leq d_Y \left(f^{(n)} \left(x^{(n)} \right), f \left(x^{(n)} \right) \right) + d_Y \left(f \left(x^{(n)} \right), f(x) \right) < \varepsilon.$$

■

Definition 4.2.3 (bounded function). A function $f : X \rightarrow Y$ from (X, d_X) to (Y, d_Y) is called bounded if its image $f(X)$ is bounded in Y i.e. there exists $y_0 \in Y$ and $R > 0$ s.t.

$$d_Y (f(x), y_0) < R \text{ for all } x \in X.$$

Proposition 4.2.3. Let $(f^{(n)})_{n=1}^{\infty}$ be a sequence of functions from (X, d_X) to (Y, d_Y) . Suppose $\lim_{n \rightarrow \infty} f^{(n)} = f$ uniformly where $f : X \rightarrow Y$. If each $f^{(n)}$ is bounded on X , then f is also bounded.

Proof. Since $\lim_{n \rightarrow \infty} f^{(n)} = f$ uniformly, so given $\varepsilon = 1$, there exists $N > 0$ s.t.

$$d_Y \left(f^{(n)}(x), f(x) \right) < 1 \text{ for all } x \in X, n \geq N.$$

Since $f^{(N)}$ is bounded, so there exists y_0 and $R_N > 0$ s.t.

$$d_Y \left(f^{(N)}(x), y_0 \right) < R_N \text{ for all } x \in X.$$

Hence,

$$\begin{aligned} d_Y (f(x), y_0) &\leq d_Y \left(f(x), f^{(N)}(x) \right) + d_Y \left(f^{(N)}(x), y_0 \right) \\ &< 1 + R_N \end{aligned}$$

for all $x \in X$, so f is bounded. ■

4.3 The Metric of Uniform Convergence

Definition 4.3.1. Suppose (X, d_X) and (Y, d_Y) be metric spaces. We let $B(X \rightarrow Y)$ denotes the set of all bounded functions from X to Y i.e.

$$B(X \rightarrow Y) = \{f \mid f : X \rightarrow Y \text{ is bounded}\}.$$

If $X \neq \emptyset$, we define a metric d_{∞} on $B(X \rightarrow Y)$ by

$$d_{\infty} (f, g) = \sup_{x \in X} d_Y (f(x), g(x))$$

for all $f, g \in B(X \rightarrow Y)$.

Proposition 4.3.1. If X is non-empty, then d_{∞} is a metric on $B(X \rightarrow Y)$.

Proof. Given $f, g \in B(X \rightarrow Y)$, then there exists $y_f, y_g \in Y$ and $M_f, M_g > 0$ s.t.

$$d_Y (f(x), y_f) < M_f \text{ and } d_Y (g(x), y_g) < M_g \text{ for all } x \in X.$$

Hence,

$$d_Y (f(x), g(x)) \leq d_Y (f(x), y_f) + d_Y (y_f, y_g) + d_Y (y_g, g(x)) < M_f + M_g + d_Y (y_f, y_g),$$

which means $\sup_{x \in X} d_Y (f(x), g(x))$ exists and ≥ 0 , and thus d_{∞} is well-defined.

Now since

$$(1) d_\infty(f, g) = \sup_{x \in X} d_Y(f(x), g(x)) \geq 0.$$

$$(2) d_\infty(f, g) = d_\infty(g, f).$$

$$(3) \text{ For } f, g, h \in B(X \rightarrow Y),$$

$$d_Y(f(x), h(x)) \leq d_Y(f(x), g(x)) + d_Y(g(x), h(x)) \leq d_\infty(f, g) + d_\infty(g, h),$$

$$\text{so } \sup_{x \in X} d_Y(f(x), h(x)) \leq d_\infty(f, g) + d_\infty(g, h).$$

$$(4) d_\infty(f, g) = 0 \text{ iff } \sup_{x \in X} d_Y(f(x), g(x)) = 0 \text{ iff } d_Y(f(x), g(x)) = 0 \text{ for all } x \in X \text{ iff } f(x) = g(x) \text{ for all } x \in X.$$

So d_∞ is a metric. ■

Proposition 4.3.2. Let (X, d_X) and (Y, d_Y) be metric spaces. Let $(f^{(n)})_{n=1}^\infty$ be a sequence of functions in $B(X \rightarrow Y)$, and let f be another function in $B(X \rightarrow Y)$. Then

$$f^{(n)} \rightarrow f \text{ in } d_\infty (= d_{B(X \rightarrow Y)}) \Leftrightarrow f^{(n)} \rightarrow f \text{ uniformly.}$$

Proof.

(\Rightarrow) Since $\lim_{n \rightarrow \infty} d_\infty(f^{(n)}, f) = 0$. Given $\varepsilon > 0$, there exists $N > 0$ s.t. $n \geq N$ implies

$$\sup_{x \in X} d_Y(f^{(n)}(x), f(x)) = d_\infty(f^{(n)}, f) < \varepsilon,$$

so

$$d_Y(f^{(n)}(x), f(x)) \leq \sup_{x \in X} d_Y(f^{(n)}(x), f) < \varepsilon$$

whenever $n \geq N$, so $f^{(n)} \rightarrow f$ uniformly.

(\Leftarrow) DIY

Now let $C(X \rightarrow Y)$ be the set of bounded and continuous function, so $C(X \rightarrow Y) \subseteq B(X \rightarrow Y)$.

Theorem 4.3.1. If Y is complete, then $C(X \rightarrow Y)$ is a complete metric space. (The metric is d_∞ intersected to $C(X \rightarrow Y)$).

Proof. Given any Cauchy sequence $\{f^{(n)}\}_{n=1}^\infty$ in $(C(X \rightarrow Y), d_\infty)$, then $f^{(n)} : X \rightarrow Y$ is continuous and bounded. Given $\varepsilon > 0$, there exists $N > 0$ s.t.

$$\sup_{x \in X} d_Y(f^{(n)}(x), f^{(m)}(x)) = d_\infty(f^{(n)}, f^{(m)}) < \frac{\varepsilon}{2} \text{ for all } n, m \geq N.$$

Now fix $x \in X$. Consider the sequence $\{f^{(n)}(x)\}_{n=1}^\infty$ in Y , so $\{f^{(n)}(x)\}_{n=1}^\infty$ is Cauchy in Y . Now since Y is complete, so $\lim_{n \rightarrow \infty} f^{(n)}(x)$ exists. Let $f(x) = \lim_{n \rightarrow \infty} f^{(n)}(x)$. If we set up $f(x)$ similarly for all $x \in X$ to construct f , then we give a claim.

Claim 4.3.1. $\lim_{n \rightarrow \infty} d_\infty(f^{(n)}, f) = 0$.

Proof. Fix $\varepsilon > 0$, choose $N > 0$ s.t. $d_\infty(f^{(n)}, f^{(m)}) < \frac{\varepsilon}{2}$ for all $n, m \geq N$. Then for all $n \geq N$ we know for all $x \in X$

$$\begin{aligned} d_Y(f^{(n)}(x), f(x)) &= \lim_{m \rightarrow \infty} d(f^{(n)}(x), f^{(m)}(x)) \leq \sup_{m \geq N, x \in X} d(f^{(n)}(x), f^{(m)}(x)) \\ &= \sup_{m \geq N} d_\infty(f^{(n)}, f^{(m)}) \leq \frac{\varepsilon}{2}. \end{aligned}$$

Hence, $\lim_{n \rightarrow \infty} d_\infty(f^{(n)}, f) = 0$. ⊗

By this claim, we know $f^{(n)} \rightarrow f$, so Y is complete.

Now since $f^{(n)} \rightarrow f$ on d_∞ , so $f^{(n)} \rightarrow f$ uniformly by [Proposition 4.3.2](#), and since $\{f^{(n)}\}_{n=1}^\infty$ is continuous, so f is continuous by [Corollary 4.2.1](#) we know f is continuous, and by [Proposition 4.2.3](#), we know f is bounded, so $f \in C(X \rightarrow Y)$. Thus, we know $\{f^{(n)}\}_{n=1}^\infty$ converges in $C(X \rightarrow Y)$, so $C(X \rightarrow Y)$ is complete. ■

Lecture 14

Lemma 4.3.1 (HW6 P4). Let (X, \mathcal{F}) be a topological space, and $K \subseteq X$ and K is compact, then if X is Hausdorff, then K is closed.

16 Oct. 10:20

Lemma 4.3.2. Let (Y, d_Y) be a metric space and for any $a \in Y$, and we have a map $\varphi : Y \rightarrow \mathbb{R}$ defined by $\varphi(y) = d_Y(a, y)$, then φ is continuous. In fact,

$$|\varphi(y) - \varphi(y')| \leq d_Y(y, y').$$

Proof. Since

$$\varphi(y) = d_Y(a, y) \leq d_Y(a, y') + d_Y(y', y) = \varphi(y') + d_Y(y', y),$$

so

$$|\varphi(y) - \varphi(y')| \leq d_Y(y, y').$$

Thus, if given $\varepsilon > 0$, then choose $\delta = \varepsilon$, then we know if $d_Y(y, y') < \delta = \varepsilon$, then

$$|\varphi(y) - \varphi(y')| \leq d_Y(y, y') < \delta = \varepsilon,$$

so φ is continuous. ■

Remark 4.3.1. Suppose $\lim_{n \rightarrow \infty} y_n = y$ in Y , then $\lim_{n \rightarrow \infty} d_Y(y_n, a) = d_Y(y, a)$.

Lemma 4.3.3. If $\lim_{n \rightarrow \infty} a_n = a$ in (Y, d_Y) . Given any $N \in \mathbb{N}$, then

$$\inf_{m \geq N} a_m \leq \lim_{n \rightarrow \infty} a_n \leq \sup_{m \geq N} a_m.$$

Proof. For any $K \geq N$, we have

$$\inf_{m \geq N} a_m \leq a_K \leq \sup_{m \geq N} a_m,$$

We know that $\lim_{K \rightarrow \infty} a_K$ exists by Squeeze Theorem, so we have

$$\inf_{m \geq N} a_m \leq \lim_{k \rightarrow \infty} a_k \leq \sup_{m \geq N} a_m.$$

Theorem 4.3.2 (Reprove Theorem 4.3.1). Let (X, d_X) be a metric space, and (Y, d_Y) be a com-

plete metric space. Let $C(X \rightarrow Y)$ be the space of continuous and bounded function. Then $(C(X \rightarrow Y), d_\infty)$ is a complete metric space, where

$$d_\infty(f, g) = \sup_{x \in X} d_Y(f(x), g(x)) \text{ for } f, g \in C(X \rightarrow Y).$$

Proof. Given a Cauchy sequence $\{f^{(n)}\}_{n=1}^\infty$ in $(C(X \rightarrow Y), d_\infty)$, then we want to show there exists $f \in C(X \rightarrow Y)$ s.t. $\lim_{n \rightarrow \infty} d_\infty(f_n, f) = 0$. i.e. $f_n \rightarrow f$ uniformly by [Proposition 4.3.2](#). Given $\varepsilon > 0$, then there exists $N > 0$ s.t. $\sup_{x \in X} d_Y(f_n(x), f_m(x)) = d_\infty(f_n, f_m) < \frac{\varepsilon}{2}$ for all $n, m \geq N$. This implies that $\{f^{(n)}(x)\}_{n=1}^\infty$ is Cauchy in Y for all $x \in X$. Since Y is complete, so $\lim_{n \rightarrow \infty} f^{(n)}(x)$ exists in Y for all $x \in X$. Now we define $f(x) := \lim_{n \rightarrow \infty} f^{(n)}(x)$ for all $x \in X$, then for any $x \in X$, consider $n \geq N$, we know

$$d_Y(f_n(x), f(x)) = \lim_{m \rightarrow \infty} d_Y(f_n(x), f_m(x)) \text{ by Lemma 4.3.2 and } \lim_{m \rightarrow \infty} f_m(x) = f(x) \in Y.$$

By [Lemma 4.3.3](#), we know

$$d_Y(f_n(x), f(x)) = \lim_{m \rightarrow \infty} d_Y(f_n(x), f_m(x)) \leq \sup_{m \geq N} d_Y(f_n(x), f_m(x)) \leq \sup_{m \geq N} d_\infty(f_n, f_m) \leq \frac{\varepsilon}{2} < \varepsilon,$$

so f_n converges uniformly to f , and by [Corollary 4.2.1](#) and [Proposition 4.2.3](#), we know that $f \in C(X \rightarrow Y)$, and we're done. ■

Example 4.3.1. If Y is not complete, then $(C(X \rightarrow Y), d_\infty)$ may not be complete.

Proof. Let $X = [0, 1]$ with standard metric, and let $Y = \mathbb{Q}$, then note that Y is not complete. Let $r_n \in \mathbb{Q}$ and $\lim_{n \rightarrow \infty} r_n = \sqrt{2}$. If we define

$$f_n : [0, 1] \rightarrow \mathbb{Q}, \quad f_n(x) = r_n \quad \forall x \in [0, 1],$$

then

$$d_\infty(f_n, f_m) = \sup_{x \in [0, 1]} |f_n(x) - f_m(x)| = \sup |r_n - r_m|.$$

Since $\lim_{n \rightarrow \infty} r_n = \sqrt{2}$, so $\{r_n\}_{n=1}^\infty$ is Cauchy, so $\{f_n\}_{n=1}^\infty$ is Cauchy in $(C(X \rightarrow Y), d_\infty)$. Note that $\lim_{n \rightarrow \infty} f_n = f$ but f is not a function from $[0, 1]$ to \mathbb{Q} since $f(x) = \sqrt{2}$ for all $x \in [0, 1]$. *

Note 4.3.1. I think uniformly convergent is unique, i.e. if (f_n) converges to f uniformly, then f is unique, but i am not sure.

End of
midterm

4.4 Series of functions

Suppose (X, d_X) is a metric space and $f^{(n)} : X \rightarrow \mathbb{R}$ and $f : X \rightarrow \mathbb{R}$ for all $n \geq 1$. We define the partial sum of $\{f^{(n)}\}_{n=1}^\infty$ by

$$S_N(x) = \sum_{i=1}^N f^{(i)}(x).$$

Definition 4.4.1. Let (X, d_X) be a metric space, and let $\{f^{(n)}\}_{n=1}^\infty$ be a sequence of functions from X to \mathbb{R} and let $f : X \rightarrow \mathbb{R}$ be another function. We say that the infinite series $\sum_{i=1}^\infty f^{(i)}$ converges pointwise to f if

$$\lim_{n \rightarrow \infty} S_N(x) = f(x) \text{ pointwise where } S_N(x) = \sum_{i=1}^N f^{(i)}(x),$$

and we say $\sum_{i=1}^{\infty} f^{(i)}$ converges to f uniformly if

$$\lim_{N \rightarrow \infty} S_N(x) = f(x) \text{ uniformly.}$$

Definition 4.4.2 (Sup norm). Let $f : X \rightarrow \mathbb{R}$ be a bounded valued function, then we can define

$$\|f\|_{\infty} := \sup_{x \in X} |f(x)| = d_{\infty}(f, 0).$$

Theorem 4.4.1 (Weierstrass M -test). Let (X, d_X) be a metric space, and $(f^{(n)})_{n=1}^{\infty}$ be a sequence of bounded, real-valued, and continuous functions on X . Suppose $\sum_{n=1}^{\infty} \|f^{(n)}\|_{\infty}$ converges, then $\sum_{n=1}^{\infty} f^{(n)}$ converges uniformly on X to a bounded and continuous, real-valued functions on X .

Proof. Let $S_N(x) = \sum_{i=1}^N f^{(i)}(x)$, then recall that $(C(X \rightarrow \mathbb{R}), d_{\infty})$ is a complete metric space. (Since \mathbb{R} is complete with standard metric). Let $M_n := \|f^{(n)}\|_{\infty} \in \mathbb{R}$. We know that $\sum_{n=1}^{\infty} M_n$ converges, then we know $\left(\sum_{n=1}^k M_n\right)_{k=1}^{\infty}$ converges, so we can define $t_N = \sum_{i=1}^N M_i$. Thus, we know $\{t_n\}_{n=1}^{\infty}$ is Cauchy, so given $\varepsilon > 0$, we know there exists $N > 0$ s.t. $m > n \geq N$ implies

$$\left| \sum_{i=n+1}^m M_i \right| = |t_m - t_n| < \varepsilon.$$

Hence, for all $m > n \geq N$,

$$\begin{aligned} d_{\infty}(S_m, S_n) &= \sup_{x \in X} \left| \sum_{i=1}^m f^{(i)}(x) - \sum_{i=1}^n f^{(i)}(x) \right| \\ &= \sup_{x \in X} \left| \sum_{i=n+1}^m f^{(i)}(x) \right| \leq \sup_{x \in X} \sum_{i=m+1}^n |f^{(i)}(x)| \leq \sum_{i=m+1}^n M_i < \varepsilon. \end{aligned}$$

Thus, $\{S_n\}_{n=1}^{\infty}$ is Cauchy in $(C(X \rightarrow \mathbb{R}), d_{\infty})$, and since \mathbb{R} is complete, so we know $S_n \rightarrow f$ in $(C(X \rightarrow \mathbb{R}), d_{\infty})$, which means $S_n \rightarrow f$ uniformly in $C(X \rightarrow \mathbb{R})$ by [Theorem 4.3.1](#) and [Proposition 4.3.2](#).

Note 4.4.1. S_N is bounded and continuous since $f^{(i)}$ is bounded and continuous for all $i \in \mathbb{N}$ and the sum of bounded and continuous function is still bounded and continuous. ■

Example 4.4.1.

- $\sum_{n=1}^{\infty} x^n = \frac{x}{1-x}$ pointwise when $x \in (-1, 1)$.
- $\sum_{n=1}^{\infty} x^n = \frac{x}{1-x}$ uniformly when $x \in [-r, r]$ where $0 < r < 1$.

Proof. Consider $S_N(x) = \sum_{i=1}^N x^n$, then

$$S_N(x) - xS_N(x) = x - x^{N+1} \Rightarrow S_N(x) = \frac{x - x^{N+1}}{1 - x}.$$

When $|x| < 1$, then $\lim_{N \rightarrow \infty} x^{N+1} = 0$, so

$$\lim_{N \rightarrow \infty} S_N(x) = \lim_{N \rightarrow \infty} \frac{x - x^{N+1}}{1 - x} = \frac{x}{1 - x}.$$

Thus, $\sum_{i=1}^{\infty} x^i$ converges to $\frac{x}{1-x}$ pointwise.

Now if $x \in [-r, r]$ with $0 < r < 1$, then $|x^i| \leq r^i$ for $x \in [-r, r]$. Thus, $\|x^i\|_{\infty} = r^i$, so $\sum_{i=1}^{\infty} \|x^i\|_{\infty} = \sum_{i=1}^{\infty} r^i$ converges to $\frac{r}{1-r}$, and thus $\sum_{i=1}^{\infty} x^i$ converges uniformly to $\frac{x}{1-x}$ by [Theorem 4.4.1](#). \circledast

Lecture 15

Example 4.4.2. Suppose

$$f_n(x) = \begin{cases} 0, & \text{if } x \leq 0 \text{ or } x \geq \frac{1}{n}; \\ 4n^2x, & \text{if } 0 \leq x \leq \frac{1}{2n}; \\ -4n^2x + 4n, & \text{otherwise } \frac{1}{2n} \leq x \leq \frac{1}{n}, \end{cases}$$

then $\lim_{n \rightarrow \infty} f_n(x) = 0$ pointwise. Also, $f_n(x)$ is continuous and $\int_{-\infty}^{\infty} f_n(x) dx = 1$. However, $\lim_{n \rightarrow \infty} f_n(x) = f(x) = 0$ for all $x \in \mathbb{R}$, so

$$\lim_{n \rightarrow \infty} \int_{-\infty}^{\infty} f_n(x) dx \neq \int_{-\infty}^{\infty} \lim_{n \rightarrow \infty} f_n(x) dx,$$

and we will talk about when will exchanging lim and integration get same result.

Note 4.4.2. The problem is that $f_n \rightarrow f$ only pointwise.

Now we quickly review Riemann integral. Assume f is continuous on $[a, b]$, then we partition the interval $[a, b]$ into subintervals $I_k = [x_{k-1}, x_k]$ for all $1 \leq k \leq n$. On I_k , find the maximum and the minimum of f on I_k , and let $M_k = \sup_{x \in I_k} f(x)$ and $m_k = \inf_{x \in I_k} f(x)$, and use the area of the rectangle with height M_k and base $x_k - x_{k-1} = \Delta X_k$, and similarly use the area of the rectangle with height m_k and base $x_k - x_{k-1} = \Delta X_k$, then we know

$$m_k \cdot \Delta X_k \leq \text{The real area of } f \text{ on } I_k \leq M_k \cdot \Delta X_k,$$

and thus we can define the upper Riemann sum to be $\sum_{k=1}^n M_k \cdot \Delta X_k$ and the lower Riemann sum to be $\sum_{k=1}^n m_k \cdot \Delta X_k$. Hence, we know

$$\text{Lower Riemann Sum} \leq \text{Area} \leq \text{Upper Riemann Sum}.$$

Also, since upper Riemann sum decreases if one has more partition and lower Riemann sum increases if one has more partition, so we can approach the area by having more partition.

Definition 4.4.3. Let $f : I \rightarrow \mathbb{R}$ be a bounded function on a bounded interval, and let p be a partition of I , we define the upper Riemann integral $U(f, p)$ and the lower Riemann sum $L(f, p)$ by

$$U(f, p) = \sum_{J \in p, J \neq \emptyset} \left(\sup_{x \in J} f(x) \right) |J|, \quad L(f, p) = \sum_{J \in p, J \neq \emptyset} \left(\inf_{x \in J} f(x) \right) |J|$$

Proposition 4.4.1 (From Analysis I). Let $f : I \rightarrow \mathbb{R}$ be a bounded function on a bounded interval I , then we define

$$\begin{aligned} \overline{\int_I} f &= \inf \{ U(f, p) : p \text{ is a partition of } I \} \quad (\text{upper integral}) \\ \underline{\int_I} f &= \sup \{ L(f, p) : p \text{ is a partition of } I \} \quad (\text{lower integral}), \end{aligned}$$

and we have

$$(1) \int_I f \leq \overline{\int_I f}$$

(2) Suppose $f \leq g$ on I , then we have

$$\int_I f \leq \int_I g, \text{ and } \overline{\int_I f} \leq \overline{\int_I g}.$$

Proof.

(1) Since $\int_I f \leq \text{real area} \leq \overline{\int_I f}$, so this is true. (Not rigorous)

(2) Since we fix any partition p on I , we have

$$L(f, p) \leq L(g, p) \quad U(f, p) \leq U(g, p),$$

so this is true.

Remark 4.4.1. More intuitively, since lower Riemann integral and upper Riemann integral are both approaching the real area (if the function is not weird), so this can be intuitively accepted.

■

Definition 4.4.4. Let $f : I \rightarrow \mathbb{R}$ be a bounded function. We say f is Riemann integrable on I if $\int_I f = \overline{\int_I f}$, and we denote it by $\int_I f$.

Remark 4.4.2. To prove f is (Riemann) integrable, we need to prove $\int_I f = \overline{\int_I f}$.

Example 4.4.3. Suppose $f : I \rightarrow \mathbb{R}$ with $I = [0, 1]$ and

$$f(x) = \begin{cases} 1, & \text{if } x \in [0, 1], x \in \mathbb{Q}; \\ 0, & \text{if } x \in [0, 1], x \notin \mathbb{Q}, \end{cases}$$

then $\overline{\int_I f} = 1$ and $\int_I f = 0$, so f is not integrable.

Note 4.4.3. $f(x) = 0$ almost everywhere on $[0, 1]$, and we say f is Lebesgue integrable and its Lebesgue integral is 0. We'll discuss this next semester.

Theorem 4.4.2. Let $f^{(n)} : [a, b] \rightarrow \mathbb{R}$ be a sequence of Riemann integrable functions. Suppose $\lim_{n \rightarrow \infty} f^{(n)} = f$ uniformly where $f : [a, b] \rightarrow \mathbb{R}$, then f is also Riemann integrable and $\lim_{n \rightarrow \infty} \int_I f^{(n)} = \int_I f$, or equivalently

$$\lim_{n \rightarrow \infty} \int_I f^{(n)} = \int_I \lim_{n \rightarrow \infty} f^{(n)}.$$

Proof. First, we want to show that $\overline{\int_I f} = \int_I(f)$, then since $f_n \rightarrow f$ uniformly on $[a, b]$, so given $\varepsilon > 0$, $\exists N > 0$ s.t. $|f_n(x) - f(x)| < \varepsilon$ for all $n \geq N$ and $x \in [a, b]$. Thus, we have

$$f_n(x) - \varepsilon < f(x) < f_n(x) + \varepsilon \quad \forall n \geq N \text{ and } x \in [a, b].$$

Hence, we have

$$\int_I (f_n - \varepsilon) \leq \int_I f, \quad \overline{\int_I f} \leq \overline{\int_I (f_n + \varepsilon)} \quad \forall n \geq N,$$

which gives

$$\int_I f_n - \varepsilon(b-a) \leq \int_I f, \quad \overline{\int_I f} \leq \overline{\int_I f_n} + \varepsilon(b-a) \quad \forall n \geq N.$$

Now since f_n is Riemann integrable, so $\int_I f_n = \overline{\int_I f_n} = \int_I f_n$. Hence, we have

$$\int_I f_n - \varepsilon(b-a) \leq \int_I f \leq \int_I f_n + \varepsilon(b-a) \quad \forall n \geq N.$$

Hence,

$$\overline{\int_I f} - \int_I f \leq 2\varepsilon(b-a) \quad \forall \varepsilon > 0,$$

which gives $\overline{\int_I f} = \int_I f$. Hence, f is Riemann integrable.

Also, we have

$$\int_I f_n - \varepsilon(b-a) \leq \int_I f \leq \int_I f_n + \varepsilon(b-a) \quad \forall n \geq N,$$

so we have

$$\left| \int_I f - \int_I f_n \right| \leq \varepsilon(b-a) \quad \forall n \geq N,$$

which gives $\lim_{n \rightarrow \infty} \int_I f^{(n)} = \int_I f$. ■

Theorem 4.4.3. Let $f^{(n)} : [a, b] \rightarrow \mathbb{R}$ be a sequence of Riemann integrable function. Suppose $\sum_{n=1}^{\infty} f^{(n)}(x)$ converges uniformly, and let $f(x) := \sum_{n=1}^{\infty} f^{(n)}(x)$, then f is Riemann integrable and

$$\sum_{n=1}^{\infty} \int_I f^{(n)} = \int_I f = \int_I \sum_{n=1}^{\infty} f^{(n)}.$$

Proof. Let $S_k(x) = \sum_{i=1}^k f^{(i)}(x)$, then since $\sum_{i=1}^{\infty} f^{(i)}(x)$ converges uniformly, so $\lim_{k \rightarrow \infty} S_k(x) = f(x)$ where $f(x) = \sum_{i=1}^{\infty} f^{(i)}(x)$. Now $S_k = \sum_{i=1}^k f^{(i)}$ is a sum of Riemann integrable functions, so S_k is also Riemann integrable. By Theorem 4.4.2, we know f is Riemann integrable, and $\lim_{k \rightarrow \infty} \int_I S_k = \int_I f$, which means $\lim_{k \rightarrow \infty} \sum_{i=1}^k \int_I f^{(i)} = \int_I f$ by the linearity of Riemann integral, and thus

$$\sum_{n=1}^{\infty} \int_I f^{(n)} = \int_I f.$$

Note 4.4.4.

$$\int_I S_k = \int_I \sum_{i=1}^k f^{(i)} = \sum_{i=1}^k \int_I f^{(i)}$$

for finite k . ■

Example 4.4.4. $\sum_{n=1}^{\infty} x^n = \frac{x}{1-x}$ pointwise for $x \in (-1, 1)$, and $\sum_{n=0}^{\infty} x^n = \frac{1}{1-x}$ pointwise for $x \in (-1, 1)$, but if we fix $r \in (-1, 1)$, then $\sum_{n=0}^{\infty} x^n = \frac{1}{1-x}$ uniformly on $[-r, r]$. Now since $\sum_{n=0}^{\infty} x^n = \frac{1}{1-x}$ uniformly on $[0, r]$ for $-1 < r < 1$, then by Theorem 4.4.3, we have

$$\begin{aligned} \sum_{n=0}^{\infty} \int_0^r x^n dx &= \int_0^r \frac{1}{1-x} dx \\ \Rightarrow \sum_{n=0}^{\infty} \frac{r^{n+1}}{n+1} &= -\ln(1-r) + \ln 1 = -\ln(1-r). \end{aligned}$$

4.5 Uniform Convergence & Derivatives

We talk about two examples to show that uniform convergence does not preserve the value of derivatives at some point.

Example 4.5.1. Suppose $f_n : [0, 2\pi] \rightarrow \mathbb{R}$ and

$$f_n(x) = \frac{\sin(nx)}{\sqrt{n}},$$

then $\lim_{n \rightarrow \infty} f_n = 0$ uniformly since

$$|f_n(x)| = \left| \frac{\sin(nx)}{\sqrt{n}} \right| \leq \frac{1}{\sqrt{n}},$$

but its derivative is

$$f'_n(x) = \frac{\cos(nx) \cdot n}{\sqrt{n}},$$

so $f'_n(0) = \sqrt{n}$, and thus

$$\lim_{n \rightarrow \infty} f'_n(0) = \infty \neq f'(0) = 0.$$

Example 4.5.2. Suppose $f_n(x) = \sqrt{\frac{1}{n^2} + x^2}$, then $\lim_{n \rightarrow \infty} f_n(x) = |x|$ uniformly since

$$\begin{aligned} 0 \leq f_n(x) - |x| &= \sqrt{\frac{1}{n^2} + x^2} - |x| = \frac{\left(\sqrt{\frac{1}{n^2} + x^2} - |x|\right) \left(\sqrt{\frac{1}{n^2} + x^2} + |x|\right)}{\sqrt{\frac{1}{n^2} + x^2} + |x|} \\ &= \frac{\frac{1}{n^2}}{\sqrt{\frac{1}{n^2} + x^2}} \leq \frac{\frac{1}{n^2}}{\sqrt{\frac{1}{n^2}}} = \frac{1}{n}. \end{aligned}$$

Let $f(x) = |x|$. We have $\lim_{n \rightarrow \infty} f_n = f$ uniformly, and note that $f_n(x) = \sqrt{\frac{1}{n^2} + x^2}$ and $f'_n(x) = \frac{x}{\sqrt{\frac{1}{n^2} + x^2}}$. Note that $f'(0)$ does not exist and $\lim_{n \rightarrow \infty} f'_n(0) = 0$, so in this case $f_n \rightarrow f$ uniformly and f'_n exists, but $f'(0)$ doesn't exist.

Theorem 4.5.1. Let $[a, b]$ be an interval and for $n \geq 1$, let $f_n : [a, b] \rightarrow \mathbb{R}$ be a differentiable function whose derivative $f'_n : [a, b] \rightarrow \mathbb{R}$ is continuous. Suppose $f'_n \rightarrow g$ uniformly where $g : [a, b] \rightarrow \mathbb{R}$. Suppose $\exists x_0 \in [a, b]$ s.t. $\lim_{n \rightarrow \infty} f_n(x_0)$ exists, then \exists a differentiable f s.t. $\lim_{n \rightarrow \infty} f_n = f$ uniformly and $f' = g$.

Proof. Since f'_n is continuous and $f'_n \rightarrow g$ uniformly, then g is Riemann integrable since f'_n is Riemann integrable for all $n \in \mathbb{N}$ and by [Theorem 4.4.2](#). Also, we know

$$\lim_{n \rightarrow \infty} \int_{x_0}^x f'_n(s) ds = \int_{x_0}^x g(s) ds \text{ uniformly for } x_0, x \in [a, b]$$

since

$$\left| \int_{x_0}^x (f'_n - g)(s) ds \right| \leq \int_{x_0}^x |f'_n(s) - g(s)| ds \leq \frac{\varepsilon}{b-a} \cdot |x - x_0| \leq \frac{\varepsilon}{b-a} \cdot (b-a) = \varepsilon \quad \forall \varepsilon > 0, n \geq N$$

for some $N \in \mathbb{N}$, and Fundamental theorem of Calculus tells us $\lim_{n \rightarrow \infty} (f_n(x) - f_n(x_0)) = \int_{x_0}^x g(s) ds$ uniformly, which means $\lim_{n \rightarrow \infty} f_n(x) = \lim_{n \rightarrow \infty} f_n(x_0) + \int_{x_0}^x g(s) ds$ uniformly, and we can let f to be R.H.S. ■

Remark 4.5.1. Informally, the theorem states that if f'_n is continuous and converges uniformly and $f_n(x_0)$ converges for some x_0 , then f_n itself converges uniformly, and moreover

$$\frac{d}{dx} \left(\lim_{n \rightarrow \infty} f_n(x) \right) = \lim_{n \rightarrow \infty} f'_n(x).$$

Remark 4.5.2. We need f'_n to be continuous to ensure that f'_n is Riemann integrable (Note that we have $f'_n([a, b])$ is bounded and continuous, so f'_n is Riemann integrable). Also, we need continuity to use Fundamental Theorem of Calculus.

Corollary 4.5.1. Let $[a, b]$ be an interval and for $n \geq 1$, let $f_n : [a, b] \rightarrow \mathbb{R}$ be a differentiable function whose derivatives $f'_n : [a, b] \rightarrow \mathbb{R}$ is continuous. Suppose $\sum_{n=1}^{\infty} \|f'_n\|_{\infty}$ converges. Suppose also that $\sum_{n=1}^{\infty} f^{(n)}(x_0)$ converges for some $x_0 \in [a, b]$, then $\sum_{n=1}^{\infty} f^{(n)}$ converges uniformly to a differentiable function and

$$\frac{d}{dx} \left(\sum_{n=1}^{\infty} f_n \right) = \sum_{n=1}^{\infty} f'_n \text{ for } x \in [a, b].$$

Proof. Suppose $S_k(x) = \sum_{i=1}^k f_i(x)$ and $S'_k(x) = \sum_{i=1}^k f'_i(x)$, then since $\sum_{i=1}^{\infty} \|f'_i\|_{\infty}$ converges, then by [Weierstrass M-test](#), we know $\lim_{k \rightarrow \infty} S'_k = \sum_{i=1}^{\infty} f'_i$ uniformly. We also know that $S_k(x_0) = \sum_{i=1}^k f_i(x_0)$ converges to $\sum_{i=1}^{\infty} f_i(x_0)$ by our conditions. Now by [Theorem 4.5.1](#) (Suppose S_k here is f_n in [Theorem 4.5.1](#)), then we know $\lim_{k \rightarrow \infty} S_k = S$ uniformly for some function $S : [a, b] \rightarrow \mathbb{R}$ and $S' = \sum_{i=1}^{\infty} f'_i$, which means

$$\sum_{n=1}^{\infty} f'_n = \frac{d}{dx} S = \frac{d}{dx} \left(\lim_{k \rightarrow \infty} S_k \right) = \frac{d}{dx} \left(\sum_{n=1}^{\infty} f_n \right).$$

Note 4.5.1. $\sum_{n=1}^{\infty} \|f'_n\|_{\infty}$ converges implies f'_n is bounded for all n , so we can use Weierstrass M-test. In fact, f'_n is continuous gives f'_n is bounded since its domain is an bounded interval. ■

Example 4.5.3. $f(x) = \sum_{n=1}^{\infty} 4^{-n} \cos(32^n \pi x)$, and $f(x)$ is not differentiable anywhere.

Proof. Since

$$|4^{-n} \cos(32^{-n} \pi x)| \leq 4^{-n},$$

and $\sum_{n=1}^{\infty} 4^{-n}$ converges, so $\sum_{n=1}^{\infty} 4^{-n} \cos(32^{-n} \pi x)$ converges uniformly by Weierstrass M-test. Also, we know

$$(4^{-n} \cos(32^{-n} \pi x))' = -8^n \sin(32^n \pi x),$$

and we will learn that $f'(x)$ does not exist at any point from the exercise. (See Exercise 4.7.10 in the textbook) *

Chapter 5

Formal Power Series

Lecture 16

5.1 Review of series

30 Oct. 10:20

Definition 5.1.1. Let $(a_n)_{n=1}^{\infty}$ be a sequence of real numbers,

- (a) The limit superior or (lim sup) of a sequence (a_n) is defined by

$$\limsup_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \sup_{k \geq n} a_k.$$

Let $S_n = \sup_{k \geq n} a_k$. Note that the index set $\{k \geq n\}$ is larger than $\{k \geq n+1\}$, so $S_{n+1} \leq S_n$. Equivalently, we can define $\limsup_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} S_n$, and since S_n is decreasing, so $\lim_{n \rightarrow \infty} S_n$ exists, but it could be ∞ or $-\infty$.

- (b) Similarly we can define

$$\liminf_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \inf_{k \geq n} a_k.$$

Let $I_n = \inf_{k \geq n} a_k$, then we know $I_n \leq I_{n+1}$, so I_n is increasing, so $\lim_{n \rightarrow \infty} I_n = \liminf_{n \rightarrow \infty} a_n$ exists, but it could be ∞ or $-\infty$.

Example 5.1.1.

$$\limsup_{n \rightarrow \infty} n = \lim_{n \rightarrow \infty} \sup_{k \geq n} k = \infty.$$

$$\liminf_{n \rightarrow \infty} n = \lim_{n \rightarrow \infty} \inf_{k \geq n} k = \lim_{n \rightarrow \infty} n = \infty.$$

Definition 5.1.2. Let $\sum_{n=1}^{\infty} a_n$ be a series of real numbers, and let $S_N = \sum_{n=1}^N a_n$, then we say $\sum_{n=1}^{\infty} a_n$ converges if $\lim_{N \rightarrow \infty} S_N$ exists and

$$\sum_{n=1}^{\infty} a_n = \lim_{N \rightarrow \infty} S_N.$$

Theorem 5.1.1. If (a_n) is a sequence of real numbers, and if $\sum_{n=1}^{\infty} a_n$ converges, then $\lim_{n \rightarrow \infty} a_n = 0$.

Proof. Suppose $S_N = \sum_{n=1}^N a_n$, then we know $S_{n+1} - S_n = a_{n+1}$, then we know

$$\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} a_{n+1} = \lim_{n \rightarrow \infty} S_{n+1} - S_n = \lim_{n \rightarrow \infty} S_{n+1} - \lim_{n \rightarrow \infty} S_n = 0.$$

■

Corollary 5.1.1. If (a_n) is a sequence of real numbers, and if $\lim_{n \rightarrow \infty} a_n$ doesn't exist or $\lim_{n \rightarrow \infty} a_n \neq 0$, then $\sum_{n=1}^{\infty} a_n$ diverges.

Definition 5.1.3. We say a real series $\sum_{n=1}^{\infty} a_n$ is absolutely convergent if $\sum_{n=1}^{\infty} |a_n|$ converges.

Theorem 5.1.2. If (a_n) is a sequence of real numbers, and if $\sum_{n=1}^{\infty} a_n$ converges absolutely, then $\sum_{n=1}^{\infty} a_n$ converges.

Proof. Let $S_n = \sum_{i=1}^n a_i$, then suppose $n \geq m$, then we have

$$|S_n - S_m| = \left| \sum_{i=m+1}^n a_i \right| \leq \sum_{i=m+1}^n |a_i|.$$

Let $T_n = \sum_{i=1}^n |a_i|$, then we know $|T_n - T_m| = \sum_{i=m+1}^n |a_i|$. Since $\sum_{n=1}^{\infty} a_n$ converges absolutely, so $\lim_{n \rightarrow \infty} T_n$ exists, and thus $\{T_n\}$ is Cauchy. Since

$$|S_n - S_m| \leq |T_n - T_m|,$$

so $\{S_n\}$ is also Cauchy, which means it is convergent. ■

5.2 Formal Power Series

Definition 5.2.1. Let $a \in \mathbb{R}$. A formal power series centered at a is any series of the form

$$\sum_{n=0}^{\infty} c_n (x - a)^n$$

where $\{c_n\}_{n=0}^{\infty}$ is a sequence of real numbers. We refer c_n to the n -th coefficient of the series. Each term $c_n (x - a)^n$ is a function of x .

Example 5.2.1. $\sum_{n=0}^{\infty} n!(x - 2)^n$ is a formal power series centered at 2 but $\sum_{n=0}^{\infty} 2^x (x - 3)^n$ is not a formal power series since 2^x depends on x not on n .

Definition 5.2.2. Let $\sum_{n=0}^{\infty} c_n (x - a)^n$ be a formal power series. We define the radius of convergence R of this series to be the quantity $R = \frac{1}{\limsup_{n \rightarrow \infty} |c_n|^{\frac{1}{n}}}$ with the convention $\frac{1}{0} = +\infty$ and $\frac{1}{+\infty} = 0$.

Remark 5.2.1. The radius of convergence must be non-negative.

Lemma 5.2.1. Let (a_n) be a sequence of real number. Suppose $L = \limsup_{n \rightarrow \infty} a_n \in [0, \infty)$, then for any $\varepsilon > 0$, $\exists N > 0$ s.t. $a_n < L + \varepsilon$ for all $n \geq N$.

Proof. If $L = \infty$, then this is true. Now if L is a real number, then $L = \lim_{n \rightarrow \infty} S_n$ where $S_n = \sup_{k \geq n} a_k$. Given any $\varepsilon > 0$, $\exists N > 0$ s.t. $|S_n - L| < \varepsilon$ for all $n \geq N$, so $S_n < L + \varepsilon$ for all $n \geq N$. Hence,

$$a_n \leq \sup_{k \geq n} a_k = S_n < L + \varepsilon \quad \forall n \geq N.$$

Lemma 5.2.2. Let (a_n) be a sequence of real numbers, and let $p := \limsup_{n \rightarrow \infty} a_n$. Then for every $\varepsilon > 0$, \exists infinitely many indices n s.t. $a_n > p - \varepsilon$.

Proof. We know $p = \lim_{n \rightarrow \infty} S_n$ where $S_n = \sup_{k \geq n} a_k$, so given $\varepsilon > 0$, $\exists N > 0$ s.t.

$$|S_n - p| < \frac{\varepsilon}{2} \quad \forall n \geq N,$$

so $p - \frac{\varepsilon}{2} < S_n = \sup_{k \geq n} a_k$, which means $\exists k_1 \geq n$ s.t. $p - \frac{\varepsilon}{2} < a_{k_1}$, and let $n = k_1 + 1$ and repeat this step to get k_2 and so on, then we know $\{k_n\}$ is an infinite set. ■

Theorem 5.2.1 (Ratio Test). Suppose $\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = L \in [0, \infty)$. If $L < 1$, then $\sum_{n=0}^{\infty} a_n$ converges absolutely. If $L > 1$, then $\sum_{n=0}^{\infty} a_n$ diverges. If $L = 1$, then no conclusion.

Proof. If $L < 1$, then we know there exists r s.t. $L < r < 1$, so there exists $N > 0$ s.t. for all $n \geq N$ we have

$$\left| \frac{a_{n+1}}{a_n} \right| \leq r,$$

so we know $|a_{n+1}| \leq r|a_n|$ for all $n \geq N$, which means $|a_{n+k}| \leq r^k |a_n|$, so

$$\sum_{n=0}^{\infty} |a_n| = \sum_{n=0}^{N-1} |a_n| + \sum_{k=0}^{\infty} |a_{N+k}| = C + \sum_{k=0}^{\infty} r^k |a_N| = C + |a_N| \sum_{k=0}^{\infty} r^k,$$

which means $\sum_{n=0}^{\infty} |a_n|$ is convergent since $r < 1$.

If $L > 1$ (including $L = \infty$), then by the definition of limit, we know for some $\varepsilon > 0$, there exists $N > 0$ s.t.

$$\left| \frac{a_{n+1}}{a_n} \right| \geq 1 + \varepsilon$$

for all $n \geq N$, and thus $|a_{n+1}| \geq (1 + \varepsilon)|a_n|$ for all $n \geq N$. In particular, there must exist some $k > 0$ with $|a_k| > 0$, otherwise L is not well-defined, and thus we know $\lim_{n \rightarrow \infty} a_n \neq 0$ since $|a_n|$ is strictly increasing, so by [Theorem 5.1.1](#), we know $\sum_{n=0}^{\infty} a_n$ diverges.

If $L = 1$, then for example, we know $\sum_{n=1}^{\infty} \frac{1}{n}$ diverges but $\sum_{n=1}^{\infty} \frac{1}{n^2}$ converges. ■

Theorem 5.2.2. Let $\sum_{n=0}^{\infty} c_n(x-a)^n$ be a formal power series, and let R be its radius of convergence $R = \frac{1}{\limsup_{n \rightarrow \infty} |c_n|^{\frac{1}{n}}}$, then

- (a) $\sum_{n=0}^{\infty} c_n(x-a)^n$ diverges if $|x-a| > R$.
- (b) $\sum_{n=0}^{\infty} c_n(x-a)^n$ converges absolutely if $|x-a| < R$.
- (c) $\sum_{n=0}^{\infty} c_n(x-a)^n$ converges uniformly on $[a-r, a+r]$ when $0 < r < R$.
- (d) Let $f(x) = \sum_{n=0}^{\infty} c_n(x-a)^n$, and if $|x-a| < R$, then f is differentiable and for any $0 < r < R$, $\sum_{n=1}^{\infty} n c_n(x-a)^{n-1}$ converges uniformly to f' on $[a-r, a+r]$.
- (e) For any $[y, z] \subset (a-R, a+R)$,

$$\int_y^z f(x) dx = \sum_{n=0}^{\infty} \frac{c_n(z-a)^{n+1}}{n+1} - \sum_{n=0}^{\infty} \frac{c_n(y-a)^{n+1}}{n+1}.$$

proof from (c) to (e). Trivial by [Theorem 4.4.3](#). We may have to show the radius of convergence remains the same to show that we can write

$$\sum_{n=0}^{\infty} \frac{c_n(z-a)^{n+1}}{n+1} - \frac{c_n(y-a)^{n+1}}{n+1} = \sum_{n=0}^{\infty} \frac{c_n(z-a)^{n+1}}{n+1} - \sum_{n=0}^{\infty} \frac{c_n(y-a)^{n+1}}{n+1}.$$

■

proof of (a). Write $L := \limsup_{n \rightarrow \infty} |c_n|^{\frac{1}{n}}$, so $L = \frac{1}{R}$. Now if $|x-a| > R$, then let $S = |x-a| > R$,

and we have

$$\limsup_{n \rightarrow \infty} |c_n(x-a)^n|^{\frac{1}{n}} = \limsup_{n \rightarrow \infty} |c_n|^{\frac{1}{n}} |x-a| = |x-a| \limsup_{n \rightarrow \infty} |c_n|^{\frac{1}{n}} = SL = \frac{S}{R} > 1.$$

Choose $\varepsilon > 0$ s.t. $\frac{S}{R} - \varepsilon > 1$. From [Lemma 5.2.2](#), there exists infinitely many n s.t.

$$|c_n|^{\frac{1}{n}} |x-a| > \frac{S}{R} - \varepsilon > 1,$$

so there are infinitely many n has $|c_n(x-a)^n| > 1$, so $\lim_{n \rightarrow \infty} c_n(x-a)^n \neq 0$, and thus we know $\sum_{n=0}^{\infty} c_n(x-a)^n$ diverges. ■

proof of (b). If $|x-a| < R$, then $\frac{|x-a|}{R} < 1$ i.e. $|x-a|L < 1$ (L is same as it is in proof of (a)). Now we have $\limsup_{n \rightarrow \infty} |c_n|^{\frac{1}{n}} = L$, so we can choose $\varepsilon > 0$ s.t. $|x-a|(L+\varepsilon) < 1$, so there exists $N > 0$ s.t.

$$|c_n|^{\frac{1}{n}} < L + \varepsilon \quad \forall n \geq N \Leftrightarrow |c_n| < (L + \varepsilon)^n \Leftrightarrow |c_n(x-a)^n| \leq (L + \varepsilon)^n |x-a|^n$$

by [Lemma 5.2.1](#), so

$$\sum_{n=0}^{\infty} |c_n(x-a)^n| \leq \sum_{n=0}^{N-1} |c_n(x-a)^n| + \sum_{n=N}^{\infty} |c_n(x-a)^n| \leq \sum_{n=0}^{N-1} |c_n| |x-a|^n + \sum_{n=N}^{\infty} |(L + \varepsilon)(x-a)|^n$$

and R.H.S. converges since the left term is finite and for the right term we have $|(L + \varepsilon)(x-a)| < 1$. ■

proof of (c). Now if $|x-a| \leq r < R$, then we can choose $\varepsilon > 0$ s.t. $q = (L + \varepsilon)r < 1$ since $Lr = \frac{r}{R} < 1$. Note that

$$|(L + \varepsilon)(x-a)|^n \leq ((L + \varepsilon)r)^n = q^n,$$

and this is independent of x . (Note that $L > 0$ so we can get rid of the absolute value) Note that this means there exists $N > 0$ s.t.

$$\begin{aligned} \sum_{n=0}^{\infty} \|c_n(x-a)^n\|_{\infty} &= \sum_{n=0}^{\infty} |c_n r^n| = \sum_{n=0}^{N-1} |c_n r^n| + \sum_{n=N}^{\infty} |c_n r^n| \\ &= C + \sum_{n=N}^{\infty} \left| c_n^{\frac{1}{n}} r \right|^n \leq C + \sum_{n=N}^{\infty} |(L + \varepsilon)r|^n \leq C + \sum_{n=N}^{\infty} q^n, \end{aligned}$$

by [Lemma 5.2.1](#), and we know this means $\sum_{n=0}^{\infty} \|c_n(x-a)^n\|_{\infty}$ is convergent since $q < 1$, so by [Weierstrass M-test](#), we know $\sum_{n=0}^{\infty} c_n(x-a)^n$ converges uniformly. ■

proof of (d). Suppose $S_N(x) = \sum_{n=0}^N c_n(x-a)^n$ and

$$S'_N(x) = \sum_{n=1}^N n c_n(x-a)^{n-1} = \sum_{n=0}^{N-1} (n+1) c_{n+1}(x-a)^n.$$

Then, we know S'_N is continuous for all $N > 0$. Now we claim that the radius of convergence of $\sum_{n=0}^{\infty} (n+1) c_{n+1}(x-a)^n$ is R . Note that

$$\limsup_{n \rightarrow \infty} |(n+1) c_{n+1}|^{\frac{1}{n}} = \lim_{n \rightarrow \infty} \sup_{k \geq n} (k+1)^{\frac{1}{k}} |c_{k+1}|^{\frac{1}{k}} = \lim_{n \rightarrow \infty} (n+1)^{\frac{1}{n}} \sup_{k \geq n} |c_{k+1}|^{\frac{1}{k}}.$$

Note that we can show that $\lim_{n \rightarrow \infty} (n+1)^{\frac{1}{n}} = 1$, which is easy, so we skip here, and we have

$$\begin{aligned} \limsup_{n \rightarrow \infty} |(n+1) c_{n+1}|^{\frac{1}{n}} &= \lim_{n \rightarrow \infty} (n+1)^{\frac{1}{n}} \sup_{k \geq n} |c_{k+1}|^{\frac{1}{k}} = \lim_{n \rightarrow \infty} (n+1)^{\frac{1}{n}} \lim_{n \rightarrow \infty} \sup_{k \geq n} |c_{k+1}|^{\frac{1}{k}} \\ &= \lim_{n \rightarrow \infty} \sup_{k \geq n} |c_{k+1}|^{\frac{1}{k}} = \limsup_{n \rightarrow \infty} |c_{n+1}|^{\frac{1}{n}}. \end{aligned}$$

Now we show that $\limsup_{n \rightarrow \infty} |c_{n+1}|^{\frac{1}{n}} = \limsup_{n \rightarrow \infty} |c_n|^{\frac{1}{n}} = L$. For all $\varepsilon > 0$, there exists $N > 0$ s.t. for all $n \geq N$ we have

$$|c_n|^{\frac{1}{n}} < L + \varepsilon \Leftrightarrow |c_{n+1}|^{\frac{1}{n+1}} < L + \varepsilon \Leftrightarrow |c_{n+1}|^{\frac{1}{n}} < (L + \varepsilon)^{\frac{n+1}{n}} = (L + \varepsilon)^{1 + \frac{1}{n}}.$$

Hence, we have

$$\sup_{k \geq n} |c_{k+1}|^{\frac{1}{k}} \leq (L + \varepsilon)^{1 + \frac{1}{n}} \quad \forall n \geq N$$

since $(L + \varepsilon)^{1 + \frac{1}{n}} \geq (L + \varepsilon)^{1 + \frac{1}{k}} > |c_{k+1}|^{\frac{1}{k}}$ for all $k \geq n$. Hence, we know

$$\lim_{n \rightarrow \infty} \sup_{k \geq n} |c_{k+1}|^{\frac{1}{k}} \leq \lim_{n \rightarrow \infty} (L + \varepsilon)^{1 + \frac{1}{n}} = L + \varepsilon.$$

Since for every $\varepsilon > 0$ this is true, so $\lim_{n \rightarrow \infty} \sup_{k \geq n} |c_{k+1}|^{\frac{1}{k}} \leq L$. Now we show

$$\lim_{n \rightarrow \infty} \sup_{k \geq n} |c_{k+1}|^{\frac{1}{k}} \geq L,$$

and then we can conclude that

$$\lim_{n \rightarrow \infty} \sup_{k \geq n} |c_{k+1}|^{\frac{1}{k}} = L = \lim_{n \rightarrow \infty} \sup_{k \geq N} |c_n|^{\frac{1}{n}}.$$

For all $\varepsilon > 0$, we know there exists infinitely many n has

$$|c_n|^{\frac{1}{n}} > L - \varepsilon.$$

Hence, for every $n \in \mathbb{N}$, there exists $s_n > n$ has $|c_{s_n}|^{\frac{1}{s_n}} > L - \varepsilon$, and we collect $\{s_n\}_{n=1}^{\infty}$. Thus, we have

$$|c_{s_n}|^{\frac{1}{s_n-1}} > (L - \varepsilon)^{\frac{s_n}{s_n-1}} = (L - \varepsilon)^{1 + \frac{1}{s_n-1}}$$

for all s_n . This means

$$\sup_{k \geq n} |c_{k+1}|^{\frac{1}{k}} \geq |c_{(s_{n+1}-1)+1}|^{\frac{1}{s_{n+1}-1}} = |c_{s_{n+1}}|^{\frac{1}{s_{n+1}-1}} > (L - \varepsilon)^{1 + \frac{1}{s_{n+1}-1}},$$

and thus

$$\lim_{n \rightarrow \infty} \sup_{k \geq n} |c_{k+1}|^{\frac{1}{k}} > \lim_{n \rightarrow \infty} (L - \varepsilon)^{1 + \frac{1}{s_{n+1}-1}} = (L - \varepsilon) \lim_{n \rightarrow \infty} (L - \varepsilon)^{\frac{1}{s_{n+1}-1}} = L - \varepsilon$$

since $s_{n+1} - 1 > n$. Note that this is true for all $\varepsilon > 0$, so we know $\lim_{n \rightarrow \infty} \sup_{k \geq n} |c_{k+1}|^{\frac{1}{k}} \geq L$, and we're done.

Now since we know the radius of convergence of $\lim_{n \rightarrow \infty} S'_n$ is R , so by (c) we know S'_n converges uniformly to $\sum_{n=0}^{\infty} (n+1)c_{n+1}(x-a)^n$ since from the problem condition we have $|x-a| < R$. Also, we know $\lim_{n \rightarrow \infty} S_n(a) = 0$, which means the limit exists, so by [Theorem 4.5.1](#), we know there exists differentiable f s.t. $S_N \rightarrow f$ uniformly and $f' = g$ if we let $S'_n \rightarrow g$ uniformly. This means $S'_n \rightarrow f'$ uniformly, where $f = \sum_{n=0}^{\infty} c_n(x-a)^n$, and thus

$$S'_n = \sum_{n=0}^{\infty} (n+1)c_{n+1}(x-a)^n \rightarrow f'$$

uniformly. ■

Remark 5.2.2. If $|x-a| = R$, then $\sum_{n=0}^{\infty} c_n(x-a)^n$ may converge or diverge, and there is no conclusion.

Remark 5.2.3. If $f(x) = \sum_{n=0}^{\infty} c_n(x-a)^n$ is a formal power series, and R is the radius of convergence

of f , then the radius of convergence of

$$f'(x) = \sum_{n=1}^{\infty} n c_n (x-a)^{n-1}, \quad \int_y^x f(x) dx = \sum_{n=0}^{\infty} \frac{c_n (z-a)^{n+1}}{n+1} - \sum_{n=0}^{\infty} \frac{c_n (y-a)^{n+1}}{n+1}$$

are both R on $[a-r, a+r]$ for some $r < R$ and $[y, z] \subseteq (a-R, a+R)$.

Lecture 17

5.3 Real Analytic Functions

4 Nov. 9:10

A function $f(x)$ that is representable as a power series near a point is called real analytic at that point.

- Intuitively: f can be written as $\sum_{n=0}^{\infty} c_n (x-a)^n$ in some neighborhood of a .
- Consequences (later): such an f is continuous and C^∞ in that neighborhood since no matter how many times you differentiate this f , it remains a power series.

Definition 5.3.1 (Real analytic functions). Let $E \subseteq \mathbb{R}$ and $f : E \rightarrow \mathbb{R}$. If a is an interior point of E , we say that f is real analytic at a if there exists $r > 0$ and a power series

$$\sum_{n=0}^{\infty} c_n (x-a)^n$$

centered at a with radius of convergence $\geq r$, which converges to $f(x)$ for all $x \in (a-r, a+r) \subseteq E$. If E is open and f is real analytic at every $a \in E$, then f is real analytic on E .

Remark 5.3.1. This power series converges to uniformly automatically by (c) of [Theorem 5.2.2](#).

Remark 5.3.2. Informally, a function is real analytic at a implies it can be represented as a power series whose radius of convergence is bigger than 0.

Corollary 5.3.1. If f is real analytic at a , and say

$$f(x) = \sum_{n=0}^{\infty} c_n (x-a)^n,$$

converges to $f(x)$ for all $x \in (a-r, a+r)$, then f is real analytic for all $x \in (a-r, a+r)$ i.e. f is real analytic on $(a-r, a+r)$.

Proof. Let $x_0 \in (a-r, a+r)$. We will show that f is analytic at x_0 .

Since $|x_0 - a| < r$, for any x we can write

$$x - a = (x - x_0) + (x_0 - a).$$

Substituting this into the given series and applying the binomial theorem gives

$$(x-a)^n = ((x-x_0) + (x_0-a))^n = \sum_{m=0}^n \binom{n}{m} (x-x_0)^m (x_0-a)^{n-m}.$$

Hence

$$f(x) = \sum_{n=0}^{\infty} c_n (x-a)^n = \sum_{n=0}^{\infty} c_n \sum_{m=0}^n \binom{n}{m} (x-x_0)^m (x_0-a)^{n-m}.$$

We now interchange the order of summation (which will be justified below) to obtain

$$f(x) = \sum_{m=0}^{\infty} \left(\sum_{n=m}^{\infty} c_n \binom{n}{m} (x_0 - a)^{n-m} \right) (x - x_0)^m.$$

Define

$$d_m = \sum_{n=m}^{\infty} c_n \binom{n}{m} (x_0 - a)^{n-m}.$$

Then

$$f(x) = \sum_{m=0}^{\infty} d_m (x - x_0)^m.$$

To justify the interchange of summation, fix a number r' such that $|x_0 - a| < r' < r$. Since the original series converges for $|x - a| < r$, there exists $M > 0$ such that $|c_n| r'^n \leq M$ for all n . Hence

$$|c_n| \leq \frac{M}{r'^n}.$$

For each m ,

$$|c_n \binom{n}{m} (x_0 - a)^{n-m}| \leq \frac{M}{r'^n} \binom{n}{m} |x_0 - a|^{n-m}.$$

Since $\binom{n}{m} \leq \frac{n^m}{m!}$ and $|x_0 - a|/r' < 1$, we obtain

$$|c_n \binom{n}{m} (x_0 - a)^{n-m}| \leq \frac{M}{m!} n^m \left(\frac{|x_0 - a|}{r'} \right)^n,$$

and the right-hand side defines a convergent series in n because $0 < |x_0 - a|/r' < 1$. Therefore the inner sum defining d_m converges absolutely, and interchanging the order of summation is justified.

Furthermore, from the last inequality it follows that the new series $\sum_{m=0}^{\infty} d_m (x - x_0)^m$ converges at least for $|x - x_0| < r - |x_0 - a|$.

Thus f can be represented by a convergent power series around x_0 , so f is analytic at x_0 . Since x_0 was arbitrary in $(a - r, a + r)$, f is analytic on the entire interval. ■

Example 5.3.1. Consider the function $f : \mathbb{R} \setminus \{1\} \rightarrow \mathbb{R}$ defined by

$$f(x) := \frac{1}{1-x}.$$

Show that $\frac{1}{1-x}$ is real analytic on $\mathbb{R} \setminus \{1\}$.

Proof. Let $f(x) = \frac{1}{1-x}$ and fix any $a \in \mathbb{R} \setminus \{1\}$. Set $y = x - a$, so that $x = a + y$. Then,

$$f(x) = \frac{1}{1-(a+y)} = \frac{1}{(1-a)-y} = \frac{1}{1-a} \cdot \frac{1}{1-\frac{y}{1-a}}.$$

Since $|1-a| > 0$, we may apply the geometric series expansion:

$$\frac{1}{1-\frac{y}{1-a}} = \sum_{n=0}^{\infty} \left(\frac{y}{1-a} \right)^n \quad \text{for } \frac{|y|}{|1-a|} < 1 \text{ i.e. } |x-a| < |1-a|.$$

Hence,

$$\frac{1}{1-x} = \frac{1}{1-a} \sum_{n=0}^{\infty} \left(\frac{y}{1-a} \right)^n = \sum_{n=0}^{\infty} \frac{y^n}{(1-a)^{n+1}} = \sum_{n=0}^{\infty} \frac{(x-a)^n}{(1-a)^{n+1}},$$

for $|x-a| < |1-a|$. Hence, f is real analytic on $\mathbb{R} \setminus \{1\}$. ⊛

Remark 5.3.3. Real analyticity parallels complex analyticity (a topic of complex analysis). In this section we focus on real functions, their power-series convergence, and differentiability properties.

From (c), (d) of [Theorem 5.2.2](#), we know if f is real analytic at a , then f is continuous and infinitely differentiable in some neighborhood (inside the interval of convergence i.e. $x \in (a - R, a + R)$) of a . We now formalize higher-order differentiability.

Definition 5.3.2 (*k -times differentiability*). Let $E \subseteq \mathbb{R}$ with every point a limit point. A function $f : E \rightarrow \mathbb{R}$ is once differentiable on E if f' exists on E . For $k \geq 2$, f is k -time differentiable on E if f' is $(k - 1)$ -times differentiable. Recursively define

$$f^{(1)} := f', \quad f^{(k)} := \left(f^{(k-1)}\right)' \quad (k \geq 2), \quad f^{(0)} := f.$$

We say f is infinitely differentiable or smooth or C^∞ if f is k -times differentiable for every $k \geq 0$.

Example 5.3.2. The function $f(x) := |x|^3$ is twice differentiable on \mathbb{R} , but not three times differentiable.

Proof. We can write

$$f(x) = \begin{cases} x^3, & x \geq 0, \\ (-x)^3 = -x^3, & x < 0. \end{cases}$$

Hence,

$$f'(x) = \begin{cases} 3x^2, & x > 0, \\ -3x^2, & x < 0. \end{cases}$$

At $x = 0$, we check

$$\lim_{x \rightarrow 0^+} \frac{f(x) - f(0)}{x - 0} = \lim_{x \rightarrow 0^+} \frac{x^3 - 0}{x - 0} = 0, \quad \lim_{x \rightarrow 0^-} \frac{f(x) - f(0)}{x - 0} = \lim_{x \rightarrow 0^-} \frac{-x^3 - 0}{x - 0} = 0,$$

so $f'(0) = 0$. Therefore,

$$f'(x) = \begin{cases} 3x^2, & x > 0, \\ 0, & x = 0, \\ -3x^2, & x < 0. \end{cases}$$

Similarly, we can check

$$f''(x) = \begin{cases} 6x, & x > 0, \\ 0, & x = 0, \\ -6x, & x < 0. \end{cases}$$

Hence, we know $f''(x) = 6|x|$, and it can easily shown that $f''(x)$ is not differentiable at $x = 0$. \circledast

This section will be extended with further theorems, proofs, and examples as more material is provided.

- (a) Uniform convergence and termwise differentiation of power series.
- (b) Uniqueness of power-series expansions and radii of convergence.

Proposition 5.3.1 (*Differentiability of real analytic functions*). Let $E \subseteq \mathbb{R}$, and a be an interior point of E , and $f : E \rightarrow \mathbb{R}$ be real analytic at a . Then, there exists $r > 0$ s.t.

$$f(x) = \sum_{n=0}^{\infty} c_n (x - a)^n, \quad x \in (a - r, a + r).$$

For every integer $k \geq 0$,

$$f^{(k)}(x) = \sum_{n=0}^{\infty} c_{n+k} \frac{(n+k)!}{n!} (x-a)^n,$$

so f is k -times differentiable on $(a-r, a+r)$. In particular, evaluating at $x = a$ gives the coefficient identity

$$c_k = \frac{f^{(k)}(a)}{k!}.$$

Proof. Fix $r > 0$ so that the power series $\sum_{n=0}^{\infty} c_n (x-a)^n$ converges to $f(x)$ for all $x \in (a-r, a+r)$ (We can pick r to be the radius of convergence). For $0 < \rho < r$, the series converges uniformly on $[a-\rho, a+\rho]$ by [Weierstrass M-test](#), hence f is continuous there. Now we do induction on k to obtain the k -th derivative formula.

- Base case $k = 0$. Trivial:

$$f^{(0)}(x) = f(x) = \sum_{n=0}^{\infty} c_n (x-a)^n.$$

- Step $k = 1$. Fix $0 < \rho < r$. On $[a-\rho, a+\rho]$,

$$\sum_{n=1}^{\infty} n c_n (x-a)^{n-1}$$

converges uniformly (again by the M-test), since for $|x-a| \leq \rho < r$,

$$|n c_n (x-a)^{n-1}| \leq n |c_n| \rho^{n-1},$$

and $\sum_{n=1}^{\infty} n |c_n| \rho^{n-1}$ converges whenever $\rho < r$ (The radius of convergence remains the same). Therefore we may differentiate termwise to get

$$f'(x) = \sum_{n=1}^{\infty} n c_n (x-a)^{n-1} = \sum_{n=0}^{\infty} c_{n+1} (n+1) (x-a)^n.$$

- Induction step. Assume for some $k \geq 1$ that

$$f^{(k)}(x) = \sum_{n=0}^{\infty} c_{n+k} \frac{(n+k)!}{n!} (x-a)^n \text{ for } x \in (a-r, a+r),$$

and that the series on the right converges uniformly on each $[a-\rho, a+\rho]$ with $0 < \rho < r$. Then, for $|x-a| < \rho$,

$$\left| \frac{(n+k)!}{n!} c_{n+k} (x-a)^n \right| \leq \frac{(n+k)!}{n!} |c_{n+k}| \rho^n.$$

Since a power series and all its termwise derivatives share the same radius of convergence r , the series $\sum_{n=0}^{\infty} \frac{(n+k+1)!}{n!} |c_{n+k+1}| \rho^n$ converges for $\rho < r$, hence by the M -test the differentiated series is uniformly convergent on $[a-\rho, a+\rho]$. Therefore,

$$\begin{aligned} f^{(k+1)}(x) &= \sum_{n=0}^{\infty} c_{n+k} \frac{(n+k)!}{n!} n (x-a)^{n-1} \\ &= \sum_{n=1}^{\infty} c_{n+k} \frac{(n+k)!}{(n-1)!} (x-a)^{n-1} \\ &= \sum_{m=0}^{\infty} c_{m+k+1} \frac{(m+k+1)!}{m!} (x-a)^m \end{aligned}$$

which is exactly the desired formula with k replaced by $k + 1$. This completes the induction. Finally, setting $x = a$ in the k -th derivative formula gives

$$f^{(k)}(a) = \sum_{n=0}^{\infty} c_{n+k} \frac{(n+k)!}{n!} (a-a)^n = c_k k!,$$

and hence

$$c_k = \frac{f^{(k)}(a)}{k!}.$$

Remark 5.3.4. Why we can deduce $\sum_{n=0}^{\infty} \frac{(n+k+1)!}{n!} |c_{n+k+1}| \rho^n$ converges for $\rho < r$? The answer is since we know the radius of convergence of $\sum_{n=0}^{\infty} \frac{(n+k+1)!}{n!} |c_{n+k+1}| (x-a)^n$ is equal to that of the radius of convergence of $\sum_{n=0}^{\infty} \frac{(n+k+1)!}{n!} c_{n+k+1} (x-a)^n$ by definition, and we know the radius of convergence of latter is equal to the radius of convergence of $f^{(k)}$. ■

Remark 5.3.5. If f is real analytic on $(a-r, a+r)$, then it admits a convergent Taylor series expansion about a . In particular,

$$f(x) = \sum_{k=0}^{\infty} \frac{f^{(k)}(a)}{k!} (x-a)^k, \quad x \in (a-r, a+r).$$

Thus, the sequence of derivatives $\{f^{(k)}(a)\}_{k=0}^{\infty}$ completely determines the values of f on the interval $(a-r, a+r)$.

Corollary 5.3.2 (Analytic to C^∞). Let E be open and $f : E \rightarrow \mathbb{R}$ real analytic on E . Then f is infinitely differentiable on E , and each $f^{(k)}$ is itself real analytic.

Proof sketch.

- (a) For any $a \in E$, f has an convergent power series on $(a-r, a+r)$.
- (b) [Proposition 5.3.1](#) gives $f^{(k)}$ via a power series, so $f^{(k)}$ is analytic at a .
- (c) Since a can be arbitrary, so f is C^∞ and every derivative is analytic. ■

Example 5.3.3. Let $f(x) = |x|$. Then f is defined on \mathbb{R} but it is not analytic on \mathbb{R} .

Proof. Fix $a \neq 0$. If $a > 0$, then on $(0, \infty)$ we have $f(x) = x$, so we may write

$$f(x) = x = a + (x-a),$$

which holds for all $x > 0$. Hence, if f is real analytic at a , then the domain of convergence of the Taylor series about a (the largest open interval centered at a contained in $(0, \infty)$) is

$$(0, 2a) = \{x : |x-a| < a\}.$$

(Since this formula holds only when $x > 0$) If $a < 0$, then on $(-\infty, 0)$ we have $f(x) = -x$, so we may write

$$f(x) = -x = -a - (x-a),$$

which holds for all $x < 0$. Hence, f is real analytic at a . Hence, the domain of convergence of the

Taylor series about a (the largest open interval centered at a contained in $(-\infty, \infty)$) is

$$(2a, 0) = \{x : |x - a| < |a|\}.$$

If $a = 0$, then if $f(x)$ is real analytic at a , then f is differentiable at a , which is false, so $f(x)$ is not real analytic at 0. Therefore, f is real analytic on $\mathbb{R} \setminus \{0\}$.

- (a) Real analyticity is a local property.
- (b) Failure at one point does not preclude analyticity elsewhere.

⊛

Remark 5.3.6. C^∞ does not imply analytic, one counterexample is in the next example.

Example 5.3.4 (Bump function).

$$f(x) = \begin{cases} e^{-\frac{1}{x^2}}, & x \neq 0 \\ 0, & x = 0. \end{cases}$$

Proof. Since all derivatives exist and vanish at $x = 0$ i.e. $f^{(k)}(0) = 0$. Hence, the Taylor series at 0 is

$$\sum_{n=0}^{\infty} \frac{f^{(n)}(0)}{n!} x^n = 0.$$

But $f(x) > 0$ for $x \neq 0$, so the series does not represent f near 0. This means f can not be analytic at 0. In the following, we explain why $f^{(k)}(0) = 0$ for all $k \in \mathbb{N}$.

Claim 5.3.1. For every $k \in \mathbb{N}$, there exists a polynomial $P_k(t)$ s.t.

$$f^{(k)}(x) = P_k\left(\frac{1}{x}\right) e^{-\frac{1}{x^2}} \quad \text{for } x \neq 0.$$

Proof. Let $t = \frac{1}{x}$ and set $g(t) = e^{-t^2}$, so that $f(x) = g(t)$ with $t = \frac{1}{x}$. Since $g'(t) = -2te^{-t^2}$ and $\frac{dt}{dx} = -\frac{1}{x^2} = -t^2$, we obtain

$$f'(x) = g'(t) \frac{dt}{dx} = (-2te^{-t^2}) (-t^2) = 2t^3 e^{-t^2} = P_1(t) e^{-t^2} = P_1(t) g(t),$$

where $P_1(t) = 2t^3$. Thus, the formula holds for $k = 1$. Now assume the formula holds for some $k \in \mathbb{N}$, i.e.

$$f^{(k)}(x) = P_k(t) g(t), \quad t = \frac{1}{x}.$$

Differentiating and using the chain rule, together with $g'(t) = -2tg(t)$ and $\frac{dt}{dx} = -t^2$, we have

$$\begin{aligned} f^{(k+1)}(x) &= \frac{d}{dx} (P_k(t) g(t)) = (P_k'(t) g(t) + P_k(t) g'(t)) \frac{dt}{dx} \\ &= (P_k'(t) g(t) - 2t P_k(t) g(t)) (-t^2) = (-t^2 P_k'(t) + 2t^3 P_k(t)) g(t). \end{aligned}$$

Hence,

$$f^{(k+1)}(x) = P_{k+1}(t) g(t), \quad \text{where } P_{k+1}(t) := -t^2 P_k'(t) + 2t^3 P_k(t),$$

and $P_{k+1}(t)$ is a polynomial whenever $P_k(t)$ is. This completes the induction. ⊛

Now we can show $f^{(k)}(0) = 0$ for all $k \in \mathbb{N}$. First, note that

$$f'(0) = \lim_{x \rightarrow 0} \frac{f(x) - f(0)}{x - 0} = \lim_{x \rightarrow 0} \frac{e^{-\frac{1}{x^2}}}{x}.$$

We first compute the right-hand limit. Let $t = \frac{1}{x}$, so that $x \rightarrow 0^+$ corresponds to $t \rightarrow +\infty$. Then

$$\lim_{x \rightarrow 0^+} \frac{e^{-\frac{1}{x^2}}}{x} = \lim_{t \rightarrow \infty} \frac{t}{e^{t^2}} = \lim_{t \rightarrow \infty} \frac{1}{2te^{t^2}} = 0$$

by the L'Hopital's rule. Similarly, for the left-hand limit,

$$\lim_{x \rightarrow 0^-} \frac{e^{-\frac{1}{x^2}}}{x} = \lim_{t \rightarrow -\infty} \frac{t}{e^{t^2}} = \lim_{t \rightarrow -\infty} \frac{1}{2te^{t^2}} = 0$$

again by the L'Hopital's rule. Since both one-sided limits are equal to 0, we conclude that $f'(0) = 0$.

We now show by induction that $f^{(k)}(0) = 0$ for all $k \in \mathbb{N}$. For $k = 1$, we have shown that $f'(0) = 0$. Assume $f^{(n)}(0) = 0$ for some $n \geq 1$. By [Claim 5.3.1](#), we know

$$f^{(n)}(x) = P_n\left(\frac{1}{x}\right) e^{-\frac{1}{x^2}},$$

and by induction we have $f^{(n)}(0) = 0$. Then,

$$f^{(n+1)}(0) = \lim_{x \rightarrow 0} \frac{f^{(n)}(0) - f^{(n)}(x)}{x} = \lim_{x \rightarrow 0} \frac{P_n\left(\frac{1}{x}\right) e^{-\frac{1}{x^2}}}{x}.$$

Similarly suppose $t = \frac{1}{x}$, and then we have

$$\begin{cases} \lim_{x \rightarrow 0^+} \frac{P_n\left(\frac{1}{x}\right) e^{-\frac{1}{x^2}}}{x} = \lim_{t \rightarrow \infty} \frac{tP_n(t)}{e^{t^2}} = 0, \\ \lim_{x \rightarrow 0^-} \frac{P_n\left(\frac{1}{x}\right) e^{-\frac{1}{x^2}}}{x} = \lim_{t \rightarrow -\infty} \frac{tP_n(t)}{e^{t^2}} = 0 \end{cases}$$

since $P_n(t)$ is polynomial and e^{t^2} is an exponential function. By this, we can conclude that $f^{(n+1)}(0) = 0$, and we're done. \circledast

Corollary 5.3.3 (Taylor's formula). If f is real analytic at a with

$$f(x) = \sum_{n=0}^{\infty} c_n(x-a)^n, \quad x \in (a-r, a+r),$$

then for all $k \geq 0$,

$$f^{(k)}(a) = k!c_k,$$

and hence

$$f(x) = \sum_{n=0}^{\infty} \frac{f^{(n)}(a)}{n!} (x-a)^n.$$

Remark 5.3.7. Taylor's formula applies only to real analytic functions. There exist functions that are C^∞ but not real analytic, whose Taylor series fails to represent the function. For example,

$$f(x) = \begin{cases} e^{-\frac{1}{x^2}}, & x \neq 0 \\ 0, & x = 0. \end{cases}$$

Corollary 5.3.4. If f is real analytic at a and admits two power series expansions

$$f(x) = \sum_{n=0}^{\infty} c_n(x-a)^n \text{ and } f(x) = \sum_{n=0}^{\infty} d_n(x-a)^n,$$

then $c_n = d_n$ for all $n \geq 0$.

Proof. By Taylor's formula, $f^{(k)}(a) = k!c_k = k!d_k$, and since $k! \neq 0$, so we can conclude $c_k = d_k$ for all k . ■

Remark 5.3.8. This means the power series expansion about a given center is unique.

Remark 5.3.9. Although the expansion at a fixed point a is unique, different centers yield distinct series.

Example 5.3.5. We have shown that

$$\frac{1}{1-x} = \sum_{n=0}^{\infty} \frac{(x-a)^n}{(1-a)^{n+1}}, \quad \text{for } |x-a| < |1-a|.$$

Hence, we have

$$\text{At } a = 0: \quad f(x) = \sum_{n=0}^{\infty} x^n, \quad |x| < 1.$$

$$\text{At } a = \frac{1}{2}: \quad f(x) = \sum_{n=0}^{\infty} 2^{n+1} \left(x - \frac{1}{2}\right)^n, \quad \left|x - \frac{1}{2}\right| < \frac{1}{2}.$$

Note that this means the radius of convergence is related to the choice of a since the choice of a affects the coefficient of the power series.

Theorem 5.3.1. Let f be real-analytic on the open interval $(a-r, a+r)$. Then the Taylor series

$$\sum_{n=0}^{\infty} \frac{f^{(n)}(a)}{n!} (x-a)^n$$

has radius of convergence $R \geq r$ and converges to $f(x)$ for all $x \in (a-r, a+r)$.

Proof. Since f is real-analytic on $(a-r, a+r)$, by definition, for every point $x_0 \in (a-r, a+r)$, there exists some $\rho > 0$ and a power series

$$\sum_{n=0}^{\infty} c_n (x-x_0)^n$$

that converges to $f(x)$ for all x with $|x-x_0| < \rho$. In particular, f is infinitely differentiable on $(a-r, a+r)$.

Step 1: Cauchy's estimates for derivatives.

Fix $0 < r' < r$ and consider the closed interval $[a-r', a+r'] \subset (a-r, a+r)$. By analyticity, there exists a constant $M > 0$ such that for all $n \geq 0$,

$$\sup_{x \in [a-r', a+r']} |f^{(n)}(x)| \leq M \frac{n!}{(r')^n}.$$

This inequality is a real-analytic analogue of *Cauchy's estimates*, which can be derived, for example, by extending f to a complex-analytic function in a strip of width r' around the real interval and applying the standard Cauchy derivative formula.

Step 2: Bound on Taylor coefficients.

Let $c_n = \frac{f^{(n)}(a)}{n!}$ be the Taylor coefficients at a . Then, using the above estimate,

$$|c_n| = \frac{|f^{(n)}(a)|}{n!} \leq \frac{M n! / (r')^n}{n!} = M \left(\frac{1}{r'}\right)^n.$$

Step 3: Ratio (or root) test for radius of convergence.

Consider the Taylor series $\sum_{n=0}^{\infty} c_n(x-a)^n$. By the root test,

$$\limsup_{n \rightarrow \infty} |c_n|^{1/n} \leq \limsup_{n \rightarrow \infty} \left(M \left(\frac{1}{r'} \right)^n \right)^{1/n} = \frac{1}{r'}.$$

The root test then implies that the series converges absolutely for all x such that

$$|x-a| < \frac{1}{\limsup_{n \rightarrow \infty} |c_n|^{1/n}} \geq r'.$$

Since $r' \in (0, r)$ is arbitrary, we can take $r' \rightarrow r$ and conclude that the radius of convergence R of the Taylor series satisfies

$$R \geq r.$$

Step 4: Conclusion.

Therefore, the Taylor series at a converges for all $x \in (a-r, a+r)$ and has radius of convergence at least r . ■

Remark 5.3.10. By [Corollary 5.3.1](#) and [Theorem 5.3.1](#), we know if f is the function, then the power series of f centered at a converges on $(a-r, a+r)$ iff f is real analytic on $(a-r, a+r)$.

Lecture 18

5.4 Abel's Theorem: Boundary behaviour of power series

6 Nov. 10:20

Let $f(x) = \sum_{n=0}^{\infty} c_n(x-a)^n$ have radius of convergence $0 < R < \infty$. Then we know the series converges absolutely for $|x-a| < R$ and diverges for $|x-a| > R$. However, on the boundary $|x-a| = R$, convergence is delicate: the series may converge or diverge.

Key message: If the series does converge at a boundary point, Abel's theorem guarantees continuity there and identifies the boundary value.

Theorem 5.4.1 (Abel's theorem). Let $f(x) = \sum_{n=0}^{\infty} c_n(x-a)^n$ be a power series with radius of convergence $0 < R < \infty$.

(i) If the series converges at $x = a + R$, then

$$\lim_{x \rightarrow a+R: x \in (a-R, a+R)} \sum_{n=0}^{\infty} c_n(x-a)^n = \sum_{n=0}^{\infty} c_n R^n.$$

(ii) If the series converges at $x = a - R$, then

$$\lim_{x \rightarrow a-R: x \in (a-R, a+R)} \sum_{n=0}^{\infty} c_n(x-a)^n = \sum_{n=0}^{\infty} c_n(-R)^n.$$

In particular, f is continuous at any boundary point where the series converges.

Remark 5.4.1. This theorem is particularly important because in general, for an arbitrary series of functions, convergence at a boundary point does not guarantee continuity there. Abel's theorem ensures that power series behave much more regularly at the endpoints of the interval of convergence.

Remark 5.4.2. Abel's theorem tells us if the boundary series $\sum_{n=0}^{\infty} c_n R^n$ or $\sum_{n=0}^{\infty} c_n(-R)^n$ converges, then the series is continuous at the boundary points, and the limiting value is exactly substituting $a+R$ or $a-R$ into the series. (note the definition of continuity).

Example 5.4.1 (Convergence at endpoint does not imply continuity).

$$f_n(x) := \begin{cases} x^n, & 0 \leq x < 1, \\ 0, & x = 1. \end{cases} \quad S(x) := \sum_{n=1}^{\infty} f_n(x).$$

Proof. For $x \in [0, 1)$, we know $f_n(x) = x^n$ and $\sum f_n(x) = \frac{x}{1-x}$. At $x = 1$, each $f_n(1) = 0$, so $S(1) = 0$. However,

$$\lim_{x \rightarrow 1^-} S(x) = \lim_{x \rightarrow 1^-} \frac{x}{1-x} = +\infty.$$

Hence, we know $S(x)$ converges at $x = 1$ but is discontinuous at $x = 1$. *

Lemma 5.4.1 (Summation by parts formula). Let $(a_n)_{n=0}^{\infty}$ and $(b_n)_{n=0}^{\infty}$ be real sequences with limits $A = \lim_{n \rightarrow \infty} a_n$ and $B = \lim_{n \rightarrow \infty} b_n$. Assume $\sum_{n=0}^{\infty} (a_{n+1} - a_n) b_n$ converges. Then

$$\sum_{n=0}^{\infty} a_{n+1} (b_{n+1} - b_n)$$

also converges and

$$\sum_{n=0}^{\infty} (a_{n+1} - a_n) b_n = AB - a_0 b_0 - \sum_{n=0}^{\infty} a_{n+1} (b_{n+1} - b_n).$$

Proof. Define the partial sums $S_N := \sum_{n=0}^N (a_{n+1} - a_n) b_n$. Then,

$$\begin{aligned} S_N &= \sum_{n=0}^N a_{n+1} b_n - \sum_{n=0}^N a_n b_n = \sum_{n=1}^{N+1} a_n b_{n-1} - \sum_{n=0}^N a_n b_n \\ &= -a_0 b_0 + \sum_{n=1}^N a_n (b_{n-1} - b_n) + a_{N+1} b_N \\ &= -a_0 b_0 - \sum_{n=1}^N a_n (b_n - b_{n-1}) + a_{N+1} b_N \\ &= -a_0 b_0 - \sum_{n=1}^N a_n (b_n - b_{n-1}) + a_{N+1} b_N \\ &= -a_0 b_0 - \sum_{n=0}^{N-1} a_{n+1} (b_{n+1} - b_n) + a_{N+1} b_N. \end{aligned}$$

Taking $N \rightarrow \infty$ and using $a_{N+1} \rightarrow A$ and $b_N \rightarrow B$ gives

$$\sum_{n=0}^{\infty} (a_{n+1} - a_n) b_n = AB - a_0 b_0 - \sum_{n=0}^{\infty} a_{n+1} (b_{n+1} - b_n),$$

■

Remark 5.4.3 (Analogy with integration by parts). This identity above is the discrete analogue of integration by parts:

$$\int_0^{\infty} f'(x) g(x) dx = f(x) g(x) \Big|_0^{\infty} - \int_0^{\infty} f(x) g'(x) dx.$$

Summation by parts transfers difference from (a_n) to (b_n) just as integration by parts transfers derivatives from f to g .

Now we prove Abel's theorem.

Proof of Abel's theorem. It suffices to prove the first assertion, namely that

$$\lim_{\substack{x \rightarrow a+R^- \\ x \in (a-R, a+R)}} \sum_{n=0}^{\infty} c_n (x-a)^n = \sum_{n=0}^{\infty} c_n R^n,$$

whenever the series $\sum_{n=0}^{\infty} c_n R^n$ converges. The corresponding result at $x = a - R$ follows immediately by replacing c_n with $(-1)^n c_n$.

We first simplify our notations. Set $d_n := c_n R^n$ and let $y := \frac{x-a}{R}$. Then $(x-a) = Ry$, and

$$c_n (x-a)^n = c_n R^n y^n = d_n y^n.$$

Thus, the assertion above is equivalent to showing that

$$\lim_{\substack{y \rightarrow 1^- \\ y \in (-1, 1)}} \sum_{n=0}^{\infty} d_n y^n = \sum_{n=0}^{\infty} d_n,$$

whenever the series $\sum_{n=0}^{\infty} d_n$ converges.

Now let $D := \sum_{n=0}^{\infty} d_n$ and define

$$S_N := \left(\sum_{n=0}^{N-1} d_n \right) - D, \quad \text{such that } S_{n+1} - S_n = d_n \text{ for } n \geq 0.$$

Choosing S_0 so that $S_1 - S_0 = d_0$ gives $S_0 = -D$. Then $S_N \rightarrow 0$ as $N \rightarrow \infty$, and

$$d_n = S_{n+1} - S_n.$$

Hence, for any $y \in (-1, 1)$,

$$\sum_{n=0}^{\infty} d_n y^n = \sum_{n=0}^{\infty} (S_{n+1} - S_n) y^n.$$

Now by [Summation by parts formula](#). If $A = \lim_{n \rightarrow \infty} a_n$ and $B = \lim_{n \rightarrow \infty} b_n$, and if $\sum_{n=0}^{\infty} (a_{n+1} - a_n) b_n$ converges, then

$$\sum_{n=0}^{\infty} (a_{n+1} - a_n) b_n = AB - a_0 b_0 - \sum_{n=0}^{\infty} a_{n+1} (b_{n+1} - b_n).$$

Applying this formula with $a_n = S_n$ and $b_n = y^n$, and noting that $\lim_{n \rightarrow \infty} y^n = 0$ for $y \in (-1, 1)$, we obtain

$$\sum_{n=0}^{\infty} d_n y^n = -S_0 y^0 - \sum_{n=0}^{\infty} S_{n+1} (y^{n+1} - y^n).$$

Since $S_0 = -D$, this becomes

$$\sum_{n=0}^{\infty} d_n y^n = D - \sum_{n=0}^{\infty} S_{n+1} (y^{n+1} - y^n).$$

Thus, to complete the proof, it remains to show that

$$\lim_{\substack{y \rightarrow 1^- \\ y \in (-1, 1)}} \sum_{n=0}^{\infty} S_{n+1} (y^{n+1} - y^n) = 0.$$

- **Step 1:** Restrict to $y \in [0, 1)$ since the limit $y \rightarrow 1^-$ is taken from below.
- **Step 2:** Estimate by absolute values:

$$\left| \sum_{n=0}^{\infty} S_{n+1} (y^{n+1} - y^n) \right| \leq \sum_{n=0}^{\infty} |S_{n+1}| |y^{n+1} - y^n| = \sum_{n=0}^{\infty} |S_{n+1}| (y^n - y^{n+1}).$$

- **Step 3:** Use the squeeze principle: It suffices to show that

$$\lim_{y \rightarrow 1^-} \sum_{n=0}^{\infty} |S_{n+1}| (y^n - y^{n+1}) = 0.$$

- **Step 4:** Since $S_n \rightarrow 0$, for any $\varepsilon > 0$ there exists N s.t. $|S_n| \leq \varepsilon$ for all $n > N$. Then

$$\sum_{n=0}^{\infty} |S_{n+1}| (y^n - y^{n+1}) \leq \sum_{n=0}^N |S_{n+1}| (y^n - y^{n+1}) + \sum_{n=N+1}^{\infty} \varepsilon (y^n - y^{n+1}).$$

- **Step 5:** The tail sum telescopes: $\sum_{n=N+1}^{\infty} (y^n - y^{n+1}) = y^{N+1}$. Thus

$$\sum_{n=0}^{\infty} |S_{n+1}| (y^n - y^{n+1}) \leq \sum_{n=0}^N |S_{n+1}| (y^n - y^{n+1}) + \varepsilon y^{N+1}.$$

- **Step 6:** Let $y \rightarrow 1^-$. The finite sum $\sum_{n=0}^N |S_{n+1}| (y^n - y^{n+1}) \rightarrow 0$, and $y^{N+1} \rightarrow 1$, which gives

$$\limsup_{y \rightarrow 1^-} \sum_{n=0}^{\infty} |S_{n+1}| (y^n - y^{n+1}) \leq \varepsilon.$$

Since $\varepsilon > 0$ is arbitrary, the limit is 0.

Hence,

$$\lim_{y \rightarrow 1^-} \sum_{n=0}^{\infty} S_{n+1} (y^{n+1} - y^n) = 0, \quad \text{and therefore} \quad \lim_{y \rightarrow 1^-} \sum_{n=0}^{\infty} d_n y^n = D.$$

Recalling that $d_n = c_n R^n$, this gives

$$\lim_{x \rightarrow a+R^-} \sum_{n=0}^{\infty} c_n (x-a)^n = \sum_{n=0}^{\infty} c_n R^n.$$

Remark 5.4.4. $\limsup_{y \rightarrow 1^-}$ means taking the limit of y to 1^- and then take sup, or equivalently

$$\limsup_{y \rightarrow 1^-} f(y) = \lim_{\delta \rightarrow 0^+} \sup \{f(y) \mid 0 < 1 - y < \delta\}.$$

■

Proposition 5.4.1 (The p -series test). The series

$$\sum_{n=1}^{\infty} \frac{1}{n^p}$$

(conventionally called a p -series) converges iff $p > 1$, and diverges for $0 < p \leq 1$.

Proposition 5.4.2 (Alternating harmonic series).

$$\sum_{n=1}^{\infty} \frac{(-1)^n}{n} \text{ converges (conditionally) by the Leibniz criterion.}$$

Now we talk about some examples.

Remark 5.4.5. Fix $a \in \mathbb{R}$ and $R > 0$. For a power series written as

$$\sum_{n=0}^{\infty} c_n (x - a)^n,$$

its radius of convergence is

$$\rho = \frac{1}{\limsup_{n \rightarrow \infty} |c_n|^{\frac{1}{n}}}.$$

When c_n contains a factor $\frac{1}{n}$ or $\frac{1}{n^2}$, we interpret the series starting at $n = 1$; the $n = 0$ term is arbitrary and does not affect ρ or endpoint behaviour.

Example 5.4.2. Consider the series

$$\sum_{n=1}^{\infty} \frac{1}{n^2 R^n} (x - a)^n.$$

Here $c_n = \frac{1}{n^2 R^n}$. Then

$$\limsup_{n \rightarrow \infty} |c_n|^{\frac{1}{n}} = \lim_{n \rightarrow \infty} \frac{1}{R} n^{-\frac{2}{n}} = \frac{1}{R}, \quad \Rightarrow \rho = R.$$

At endpoints:

- At $x = a + R$: $\sum_{n=1}^{\infty} \frac{1}{n^2}$ converges.
- At $x = a - R$: $\sum_{n=1}^{\infty} \frac{(-1)^n}{n^2}$ converges absolutely.

Hence, this series converges at both $x = a \pm R$. Hence, by Abel's theorem, we know this series is continuous at two endpoints.

Example 5.4.3. Consider the series

$$\sum_{n=0}^{\infty} \frac{1}{R^n} (x - a)^n = \sum_{n=0}^{\infty} \left(\frac{x - a}{R} \right)^n \quad (\text{geometric}).$$

Here $c_n = \frac{1}{R^n}$. Then

$$\limsup_{n \rightarrow \infty} |c_n|^{\frac{1}{n}} = \frac{1}{R}, \quad \Rightarrow \rho = R.$$

At endpoints:

- At $x = a + R$: $\sum_{n=0}^{\infty} 1$ diverges.
- At $x = a - R$: $\sum_{n=0}^{\infty} (-1)^n$ oscillates, hence diverges.

Hence, it diverges at both $x = a \pm R$.

Lecture 19

5.5 Multiplication of Power series

11 Nov. 10:20

Theorem 5.5.1 (Fubini's theorem for infinite sum, Analysis I). Let $f : \mathbb{N} \times \mathbb{N} \rightarrow \mathbb{R}$ be a function such that the double series

$$\sum_{(n,m) \in \mathbb{N} \times \mathbb{N}} f(n,m)$$

is absolutely convergent, i.e.

$$\sum_{(m,n) \in \mathbb{N} \times \mathbb{N}} |f(n, m)|$$

converges. Then

$$\sum_{n=1}^{\infty} \sum_{m=1}^{\infty} f(n, m) = \sum_{m=1}^{\infty} \sum_{n=1}^{\infty} f(n, m).$$

In particular, if $\sum_{n,m} a_n a_m$ absolutely convergent, then

$$\sum_m \sum_n a_n a_m = \sum_n \sum_m a_n a_m.$$

Theorem 5.5.2. Let $f : (a - r, a + r) \rightarrow \mathbb{R}$ and $g : (a - r, a + r) \rightarrow \mathbb{R}$ be functions analytic on $(a - r, a + r)$, with power series expansions

$$f(x) = \sum_{n=0}^{\infty} c_n (x - a)^n, \quad \text{and} \quad g(x) = \sum_{n=0}^{\infty} d_n (x - a)^n,$$

then $f \cdot g : (a - r, a + r) \rightarrow \mathbb{R}$ is also analytic on $(a - r, a + r)$, with power series expansion

$$f(x)g(x) = \sum_{n=0}^{\infty} e_n (x - a)^n,$$

where

$$e_n = \sum_{m=0}^n c_m d_{n-m}.$$

Proof. We need to show that the series

$$\sum_{n=0}^{\infty} e_n (x - a)^n$$

converges to $f(x)g(x)$ for all $x \in (a - r, a + r)$.

- **Step 1:** Absolute convergence of f and g . By our assumption f and g are analytic on $(a - r, a + r)$, so $f(x) = \sum_{n=0}^{\infty} c_n (x - a)^n$ and $g(x) = \sum_{n=0}^{\infty} d_n (x - a)^n$ converges absolutely when $|x - a| < r$. In particular, for each fixed $x \in (a - r, a + r)$, the sum

$$C := \sum_{n=0}^{\infty} |c_n (x - a)^n| \quad \text{and} \quad D := \sum_{n=0}^{\infty} |d_n (x - a)^n|$$

are finite.

- **Step 2:** Bounding the double series. Consider any $N \geq 0$, the sum

$$\begin{aligned} \sum_{n=0}^N \sum_{m=0}^{\infty} |c_m (x - a)^m d_n (x - a)^n| &= |d_0| \left(\sum_{m=0}^{\infty} |c_m (x - a)^m| \right) + \cdots + |d_N (x - a)^N| \left(\sum_{m=0}^{\infty} |c_m (x - a)^m| \right) \\ &= \left(\sum_{n=0}^N |d_n (x - a)^n| \right) \cdot \left(\sum_{m=0}^{\infty} |c_m (x - a)^m| \right) \leq D \cdot C, \end{aligned}$$

where D, C are fixed constants independent of N . This implies

$$\sum_{n=0}^{\infty} \sum_{m=0}^{\infty} |c_m (x - a)^m d_n (x - a)^n|$$

converges absolutely. By Fubini's theorem,

$$\sum_{m=0}^{\infty} \sum_{n=0}^{\infty} c_m d_n (x-a)^m (x-a)^n = \sum_{n=0}^{\infty} \sum_{m=0}^{\infty} c_m d_n (x-a)^m (x-a)^n.$$

- **Step 3:** First computations of the double series. We compute the sum in two different ways. Note that

$$f(x)g(x) = \sum_{n=0}^{\infty} \sum_{m=0}^{\infty} c_m (x-a)^m d_n (x-a)^n.$$

- **Step 4:** Second computation of the double series.

$$f(x)g(x) = \sum_{n=0}^{\infty} \sum_{m=0}^{\infty} c_m d_n (x-a)^{m+n} = \sum_{m=0}^{\infty} \sum_{n=0}^{\infty} c_m d_n (x-a)^{m+n}$$

by Fubini's theorem.

- **Step 5:** Change of variables. Let $n' = m + n$, so

$$f(x)g(x) = \sum_{m=0}^{\infty} \sum_{n'=m}^{\infty} c_m d_{n'-m} (x-a)^{n'},$$

where we adopt the convention $d_j = 0$ if $j < 0$. Hence,

$$\begin{aligned} f(x)g(x) &= \sum_{m=0}^{\infty} \sum_{n'=m}^{\infty} c_m d_{n'-m} (x-a)^{n'} + \sum_{m=0}^{\infty} \sum_{n'=0}^{m-1} c_m d_{n'-m} (x-a)^{n'} \\ &= \sum_{m=0}^{\infty} \sum_{n'=0}^{\infty} c_m d_{n'-m} (x-a)^{n'} \end{aligned}$$

- **Step 6:** Interchanging the order of summation. Since we have shown that this series converges absolutely (before changing subscript and change the order of double series, but this does not affect the convergence), so by Fubini's theorem we have

$$f(x)g(x) = \sum_{n'=0}^{\infty} \left(\sum_{m=0}^{\infty} c_m d_{n'-m} \right) (x-a)^{n'} = \sum_{n'=0}^{\infty} \left(\sum_{m=0}^{n'} c_m d_{n'-m} \right) (x-a)^{n'}$$

■

5.6 The exponential and Logarithm functions

Definition 5.6.1. For every real number x , we define

$$\exp(x) := \sum_{n=0}^{\infty} \frac{x^n}{n!}.$$

Theorem 5.6.1. The exponential function satisfies the following properties:

- For every $x \in \mathbb{R}$, $\sum_{n=0}^{\infty} \frac{x^n}{n!}$ is absolutely convergent. The radius of convergence of $\sum_{n=0}^{\infty} \frac{x^n}{n!}$ is ∞ , so $\exp(x)$ is analytic on $(-\infty, \infty)$.
- $\exp(x)$ is differentiable on \mathbb{R} and $(\exp(x))' = \exp(x)$.

(c) \exp is continuous on \mathbb{R} and for every interval $[a, b]$, we have

$$\int_a^b \exp(x) \, dx = \exp(b) - \exp(a).$$

(d) For $x, y \in \mathbb{R}$, we have $\exp(x + y) = \exp(x) \exp(y)$.

(e) We have $\exp(0) = 1$, $\exp(x) > 0$ for all x and $\exp(-x) = \frac{1}{\exp(x)}$.

(f) $\exp(x) > \exp(y)$ if $x > y$.

proof of (a). By ratio test,

$$\lim_{n \rightarrow \infty} \left| \frac{\frac{x^{n+1}}{(n+1)!}}{\frac{x^n}{n!}} \right| = \lim_{n \rightarrow \infty} \left| \frac{n!x}{(n+1)!} \right| = \lim_{n \rightarrow \infty} \left| \frac{x}{n+1} \right| = 0$$

for every $x \in \mathbb{R}$, so it is absolutely convergent for every $x \in \mathbb{R}$, and the radius of convergence is ∞ by definition, so $\exp(x) = \sum_{n=0}^{\infty} \frac{x^n}{n!}$ for all $x \in \mathbb{R}$ and $\exp(x)$ is analytic on \mathbb{R} . ■

proof of (b). Since $\exp(x)$ is analytic on \mathbb{R} , so it is infinitely differentiable on \mathbb{R} , and

$$(\exp(x))' = \frac{d}{dx} \left(\sum_{n=0}^{\infty} \frac{x^n}{n!} \right) = \sum_{n=0}^{\infty} \left(\frac{d}{dx} \frac{x^n}{n!} \right) = \sum_{n=1}^{\infty} \frac{nx^{n-1}}{n!} = \sum_{n=1}^{\infty} \frac{x^{n-1}}{(n-1)!} = \exp(x)$$

for all $x \in \mathbb{R}$. ■

proof of (c). Since \exp is differentiable, so it is continuous. Since

$$\frac{d}{dx} \exp(x) = \exp(x),$$

so by Fundamental Theorem of Calculus, we know

$$\int_a^b \exp(x) \, dx = \exp(b) - \exp(a).$$

proof of (d).

$$\begin{aligned} \exp(x) \exp(y) &= \left(\sum_{m=0}^{\infty} \frac{x^m}{m!} \right) \left(\sum_{n=0}^{\infty} \frac{y^n}{n!} \right) \\ &= \sum_{k=0}^{\infty} \sum_{m=0}^k \frac{1}{m!(k-m)!} x^m y^{k-m} = \exp(x+y) \end{aligned}$$

by binomial theorem. ■

proof of (e). $\exp(0)$ is trivial. If $x > 0$, then

$$\exp(x) = \sum_{n=0}^{\infty} \frac{x^n}{n!} > 1,$$

and since $\exp(x + (-x)) = \exp(0) = 1$, and thus by (d) we know

$$\exp(x) \exp(-x) = \exp(x + (-x)) = \exp(0) = 1. \quad \blacksquare$$

proof of (f). Trivial. ■

Definition 5.6.2 (Euler number).

$$e := \exp(1) = \sum_{n=0}^{\infty} \frac{1}{n!} = 1 + \frac{1}{1!} + \frac{1}{2!} + \dots$$

Proposition 5.6.1.

$$\exp(x) = e^x \quad \forall x \in \mathbb{R}.$$

Proof. If $n \in \mathbb{Z}$, then $\exp(n) = e^n$, which can be shown by induction. When $n = 0$, this is trivial. If $n > 0$, then

$$\exp(n) = \exp(1 + 1 + \dots + 1) = \exp(1) \exp(1) \dots \exp(1) = (\exp(1))^n = e^n,$$

so this is true. Now if $n < 0$, then $\exp(-n) = e^{-n}$, and thus

$$\exp(n) = \frac{1}{\exp(-n)} = \frac{1}{e^{-n}} = e^n.$$

Next, we show $\exp\left(\frac{p}{q}\right) = e^{\frac{p}{q}}$ for $p \in \mathbb{Z}$ and $q \in \mathbb{N}$. Note that we have

$$\left(\exp\left(\frac{p}{q}\right)\right)^q = \exp\left(\frac{p}{q} + \dots + \frac{p}{q}\right) = \exp(p) = e^p,$$

so

$$\exp\left(\frac{p}{q}\right) = (e^p)^{\frac{1}{q}} = e^{\frac{p}{q}}.$$

Hence, $\exp(x) = e^x$ for $x \in \mathbb{Q}$. Now if $x \in \mathbb{R} \setminus \mathbb{Q}$, then there exists $(x_n) \in \mathbb{Q}$ s.t. $\lim_{n \rightarrow \infty} x_n = x$. Since $\exp(x)$ is continuous, so

$$\lim_{n \rightarrow \infty} \exp(x_n) = \exp(x),$$

and since $x_n \in \mathbb{Q}$, so $\lim_{n \rightarrow \infty} e^{x_n} = \exp(x)$. Also, since e^x is continuous, so

$$\lim_{n \rightarrow \infty} e^{x_n} = e^x,$$

so combining these two results we have $\exp(x) = e^x$. ■

Lecture 20

We explain that how a^x is defined for $a > 0$ and $x \in \mathbb{R}$. If $a = 1$, then we define $1^x = 1$, and if $a < 1$, then we define $a^x := \left(\frac{1}{a}\right)^{-x}$. So we just need to define a^x for $a > 1$. 13 Nov. 10:20

- **Step 1:** Rational exponents. For integers m and positive integer n , we can define

$$a^{\frac{m}{n}} := \left(a^{\frac{1}{n}}\right)^m,$$

where $a^{\frac{1}{n}}$ is the positive number such that $\left(a^{\frac{1}{n}}\right)^n = a$, i.e. the power root of $x^n = a$.

Besides, we define $a^{r+s} = a^r a^s$ for $r, s \in \mathbb{Q}$.

Note that if $a > 1$, then $a^{\frac{1}{n}} > 1$ for $n \in \mathbb{N}$. Otherwise $0 < a^{\frac{1}{n}} \leq 1$ gives $\left(a^{\frac{1}{n}}\right)^n \leq 1$, i.e. $a \leq 1$.

Similarly, if $0 < a < 1$, then $a^{\frac{1}{n}} < 1$.

Also, we can deduce that $a^0 = 1$ for all $a > 0$, and $r > s$ implies $a^r > a^s$ for $a > 0$. Hence, we can well define a^x for $x \in \mathbb{Q}$.

- **Step 2:** Continuity near 0 for rational exponent. We first claim that if $a > 0$ and $b_n \in \mathbb{Q}$, then $\lim_{n \rightarrow \infty} b_n = 0$ implies $\lim_{n \rightarrow \infty} a^{b_n} = 1$. If $a = 1$, then this is true. If $0 < a < 1$, then

$$\lim_{n \rightarrow \infty} a^{b_n} = \lim_{n \rightarrow \infty} \left(\frac{1}{a}\right)^{-b_n},$$

and we know $\frac{1}{a} > 1$ and $\lim_{n \rightarrow \infty} -b_n = 0$, so it suffices to prove the case $a > 1$. First, we prove that $\lim_{n \rightarrow \infty} a^{\frac{1}{n}} = 1$ for all $a > 1$. Fix $\varepsilon > 0$, then $(1 + \varepsilon)^n \geq 1 + n\varepsilon \rightarrow \infty$ as $n \rightarrow \infty$. Thus, there exists $N > 0$ s.t.

$$(1 + \varepsilon)^N \geq 1 + N\varepsilon \geq a \Leftrightarrow a^{\frac{1}{N}} \leq 1 + \varepsilon,$$

so $n \geq N$ implies

$$0 < a^{\frac{1}{n}} \leq a^{\frac{1}{N}} \leq 1 + \varepsilon \Leftrightarrow \left| a^{\frac{1}{n}} - 1 \right| < \varepsilon \quad \text{for } n \geq N.$$

Thus, $\lim_{n \rightarrow \infty} a^{\frac{1}{n}} = 1$. Now for some (b_n) s.t. $\lim_{n \rightarrow \infty} b_n = 0$, we know there exists L s.t. $n \geq L$ implies $|b_n| < \frac{1}{N}$. Recall that $a^{\frac{1}{N}} < 1 + \varepsilon$, so we have $\frac{1}{1+\varepsilon} < a^{-\frac{1}{N}}$, then since

$$a^{-|b_n|} \leq a^{b_n} \leq a^{|b_n|} \quad \text{when } a > 1$$

and thus

$$a^{-\frac{1}{N}} \leq a^{b_n} \leq a^{\frac{1}{N}} \quad \text{when } n \geq L.$$

Thus,

$$\frac{1}{1 + \varepsilon} < a^{b_n} < 1 + \varepsilon,$$

which gives

$$-\varepsilon < \frac{-\varepsilon}{1 + \varepsilon} = \frac{1}{1 + \varepsilon} - 1 < a^{b_n} - 1 < \varepsilon,$$

so $|a^{b_n} - 1| < \varepsilon$ for $n \geq L$, and thus $\lim_{n \rightarrow \infty} a^{b_n} = 1$. This proves the continuity of rational exponent near 0.

- **Step 3:** Continuity on rational exponents. We claim that for $a > 0$. The function $f : \mathbb{Q} \rightarrow \mathbb{R}$ defined by $f(r) = a^r$ is continuous on \mathbb{Q} . Fix $r_0 \in \mathbb{Q}$ and $(r_n) \subseteq \mathbb{Q}$ s.t. $\lim_{n \rightarrow \infty} r_n = r_0$, then

$$a^{r_n} - a^{r_0} = a^{r_0} (a^{r_n - r_0} - 1).$$

Note that a^{r_0} is fixed, and $\lim_{n \rightarrow \infty} r_n - r_0 = 0$, so we know

$$\lim_{n \rightarrow \infty} a^{r_n - r_0} = 1,$$

which shows $\lim_{n \rightarrow \infty} a^{r_n} - a^{r_0} = 0$ and thus $\lim_{n \rightarrow \infty} a^{r_n} = a^{r_0}$.

- **Step 4:** Real exponents. Let $(r_n) \subseteq \mathbb{Q}$ with $\lim_{n \rightarrow \infty} r_n = x$. We'll show that (a^{r_n}) is Cauchy in \mathbb{R} . We just need to prove the case $a > 1$. Since $\lim_{n \rightarrow \infty} r_n = x$, so there exists $r \in \mathbb{Q}_{>0}$ s.t. $r_n \leq r$ for all n . Since $\lim_{n \rightarrow \infty} a^{\frac{1}{n}} = 1$, and $\frac{\varepsilon}{a^r} > 0$, so we know there exists $N > 0$ s.t.

$$\left| a^{\frac{1}{N}} - 1 \right| < \frac{\varepsilon}{a^r}.$$

Now since $r_n \rightarrow x$, so there exists L s.t. $m, n \geq L$ implies $|r_n - r_m| < \frac{1}{N}$, so

$$|a^{r_n} - a^{r_m}| = |a^{r_m}| |a^{r_n - r_m} - 1| \leq a^r \left| a^{\frac{1}{N}} - 1 \right| < \varepsilon.$$

Hence, $\{a^{r_n}\}$ is Cauchy. Now we can define

$$a^x := \lim_{n \rightarrow \infty} a^{r_n}$$

for $x \in \mathbb{R}$. Also, this is independent of the choice of $r_n \rightarrow x$. Since if we have $\lim_{n \rightarrow \infty} r_n = \lim_{n \rightarrow \infty} s_n = x$, where $(r_n), (s_n) \in \mathbb{Q}$, then $\lim_{n \rightarrow \infty} a^{r_n} = \lim_{n \rightarrow \infty} a^{s_n}$. This can be shown by we know $(r_n - s_n) \rightarrow 0$ and $(r_n - s_n) \subseteq \mathbb{Q}$, so $\lim_{n \rightarrow \infty} a^{r_n - s_n} = 1$, and since $\lim_{n \rightarrow \infty} a^{r_n}$ and $\lim_{n \rightarrow \infty} a^{s_n}$ both exists, so

$$\lim_{n \rightarrow \infty} a^{s_n} = \left(\lim_{n \rightarrow \infty} a^{r_n - s_n} \right) \left(\lim_{n \rightarrow \infty} a^{r_n} \right) = \lim_{n \rightarrow \infty} a^{r_n}.$$

- **Conclusion:** We can show that exponential function a^x is strictly increasing on \mathbb{R} when $a > 1$ since $a^{r+s} = a^r a^s$ and $(a^r)^s = a^{rs}$.

Now since we know $\exp(x) = 1 + \frac{1}{1!} + \cdots > 2$, so $\exp(x) = e^x$ is strictly increasing on \mathbb{R} , so the inverse function exists.

Definition 5.6.3. We define $\log : (0, \infty) \rightarrow \mathbb{R}$ (also denoted by \ln) to be the inverse function of exponential function. Thus,

$$\exp(\log(x)) = x, \text{ for } 0 < x < \infty, \quad \log(\exp(x)) = x \text{ for } x \in \mathbb{R}.$$

Recall the alternating series test:

Theorem 5.6.2 (Alternating series test). Let (a_n) be a sequence in \mathbb{R} with $a_n \geq 0$ and $a_{n+1} \leq a_n$ for $n \geq m$ for some m . Then,

$$\sum_{n=m}^{\infty} (-1)^n a_n$$

converges iff $\lim_{n \rightarrow \infty} a_n = 0$.

Theorem 5.6.3 (Logarithm properties). The logarithm function satisfies the following properties:

- (a) For $x \in (0, \infty)$, we have $\frac{d}{dx} \ln x = \frac{1}{x}$. Hence, $\int_a^b \frac{1}{x} dx = \ln b - \ln a$ when $[a, b] \subseteq (0, \infty)$.
- (b) For $x, y \in (0, \infty)$, we have $\ln(xy) = \ln x + \ln y$.
- (c) $\ln 1 = 0$, $\ln\left(\frac{1}{x}\right) = -\ln x$ for $x \in (0, \infty)$.
- (d) For $x \in (0, \infty)$ and $y \in \mathbb{R}$, we have $\ln(x^y) = y \ln(x)$.
- (e) For $x \in (-1, 1)$,

$$\ln(1-x) = -\sum_{n=1}^{\infty} \frac{x^n}{n},$$

while for $x \in (0, 2)$,

$$\ln x = \sum_{n=1}^{\infty} \frac{(-1)^{n+1}(x-1)^n}{n}.$$

proof of (a). Recall $\exp'(x) = \exp(x)$ and $\exp(\ln(x)) = x$. Thus, by chain rule,

$$1 = (x)' = [\exp(\ln(x))]' = \exp'(\ln(x)) \cdot (\ln x)',$$

which gives

$$\frac{1}{x} = \frac{1}{\exp(\ln(x))} = (\ln x)'.$$

■

proof of (b).

$$\exp(\ln(xy)) = xy = \exp(\ln(x)) \exp(\ln(y)) = \exp(\ln x + \ln y).$$

Since \exp is injective (since strictly increasing), so $\ln(xy) = \ln(x) + \ln(y)$.

■

proof of (c). Since $\exp(\ln(1)) = 1$ and $\exp(0) = 1$ and \exp is injective, so $\ln(1) = 0$. Besides,

$$0 = \ln 1 = \ln\left(x \cdot \frac{1}{x}\right) = \ln x + \ln\left(\frac{1}{x}\right)$$

for all $x \in (0, \infty)$, so $\ln\left(\frac{1}{x}\right) = -\ln x$.

■

proof of (d). Note that

$$\begin{aligned} \exp(y \ln(x)) &= e^{y \ln x} = (e^{\ln x})^y = x^y. \\ \exp(\ln(x^y)) &= x^y, \end{aligned}$$

so we know $y \ln x = \ln(x^y)$.

■

proof of (e). Note that

$$\frac{d}{dx} \ln(1-x) = -\frac{1}{1-x} = (-1) \sum_{n=0}^{\infty} x^n \quad \text{when } |x| < 1.$$

Hence, if $t \in (-1, 1)$,

$$\int_0^t \left(\frac{d}{dx} \ln(1-x) \right) dx = \int_0^t (-1) \sum_{n=0}^{\infty} x^n dx,$$

so we have

$$\ln(1-x) \Big|_0^t = (-1) \sum_{n=0}^{\infty} \frac{t^{n+1}}{n+1},$$

which gives

$$\ln(1-t) = (-1) \sum_{n=0}^{\infty} \frac{t^{n+1}}{n+1} = (-1) \sum_{n=1}^{\infty} \frac{t^n}{n} \quad \text{when } |t| < 1.$$

Now replace t by $1-x$, then

$$\ln(1-(1-x)) = - \sum_{n=1}^{\infty} \frac{(1-x)^n}{n} = \sum_{n=1}^{\infty} \frac{(-1)^{n+1}(x-1)^n}{n}$$

when $|1-x| < 1$, i.e. $x \in (0, 2)$. ■

Corollary 5.6.1.

$$\lim_{x \rightarrow 2^-} \ln x = \sum_{n=1}^{\infty} \frac{(-1)^{n+1}}{n}.$$

Proof. When $x = 2$, we know the power series of $\ln 2$ is

$$\sum_{n=1}^{\infty} \frac{(-1)^{n+1}(x-1)^n}{n} = \sum_{n=1}^{\infty} \frac{(-1)^{n+1}}{n} = (-1) \cdot \sum_{n=1}^{\infty} \frac{(-1)^n}{n},$$

and since $\frac{1}{n+1} < \frac{1}{n}$ and $\lim_{n \rightarrow \infty} \frac{1}{n} = 0$, so by alternating series test $\sum_{n=1}^{\infty} \frac{(-1)^{n+1}}{n}$ converges, and thus by Abel's theorem we have

$$\lim_{x \rightarrow 2^-} \ln x = \sum_{n=1}^{\infty} \frac{(-1)^{n+1}}{n}. \quad \text{■}$$

Lecture 21

5.7 A digression on complex numbers

18 Nov. 10:20

Definition 5.7.1. The complex numbers \mathbb{C} are the set of all numbers of the form $a + bi$, $a, b \in \mathbb{R}$, where $i = \sqrt{-1}$, i.e. $\mathbb{C} = \{a + bi \mid a, b \in \mathbb{R}\}$, and we can define $+$, $-$, $*$, $/$ on \mathbb{C} .

First, we have $i^2 = -1$. Now if $z, w \in \mathbb{C}$ where $z = a + bi$ and $w = c + di$, then

$$\begin{aligned} z + w &= (a + c) + (b + d)i \\ z \cdot w &= (a + bi)(c + di) \\ &= a(c + id) + bi(c + id) \\ &= (ac - bd) + i(ad + bc) \\ (-1) \cdot w &= -a - bi \\ z - w &= z + (-1) \cdot w = (a - c) + (b - d)i. \end{aligned}$$

For each $z = a + ib$, we can define the complex conjugate of z by $\bar{z} = a - ib$. We can also define the absolute value (or modules) of z by $|z| = \sqrt{a^2 + b^2}$ where $z = a + bi$. Also,

$$(1) z \cdot \bar{z} = |z|^2, \quad (2) \text{ if } z \neq 0, \text{ then } \frac{1}{z} = \frac{\bar{z}}{|z|^2}.$$

Remark 5.7.1. We can identify $\mathbb{C} \simeq \mathbb{R}^2$ by $a + ib \rightarrow (a, b)$.

Lemma 5.7.1. The complex numbers are an addition group, i.e. if $z_1, z_2, z_3 \in \mathbb{C}$, then the addition satisfies the following properties:

- Commutativity: $z_1 + z_2 = z_2 + z_1$.
- Associativity: $(z_1 + z_2) + z_3 = z_1 + (z_2 + z_3)$.
- Identity: $z_1 + 0 = z_1$ where $0 = 0 + 0$.
- Inverse: $0 = z_1 + (-z_1) + (-z_1) + z_1$.

Lemma 5.7.2. Complex numbers form a ring, i.e. if $z_1, z_2, z_3 \in \mathbb{C}$, then

- (a) $z_1 z_2 = z_2 z_1$.
- (b) $(z_1 \cdot z_2) \cdot z_3 = z_1 \cdot (z_2 \cdot z_3)$.
- (c) $z_1 \cdot 1 = z_1$.
- (d) $z_1(z_2 + z_3) = z_1 z_2 + z_1 z_3$. Also, $(z_1 + z_2)z_3 = z_1 z_3 + z_2 z_3$.

Lemma 5.7.3. We have

- (1) $\overline{z + w} = \bar{z} + \bar{w}$.
- (2) $\overline{z \cdot w} = \bar{z} \cdot \bar{w}$.
- (3) $\bar{\bar{z}} = z$.
- (4) $z = \bar{z}$ iff $z \in \mathbb{R}$.

Proposition 5.7.1. Let $z, w \in \mathbb{C}$. Then,

- (1) $|z + w| \leq |z| + |w|$
- (2) $|z \cdot w| = |z| \cdot |w|$.

Proof. Let $z = a + bi$ and $w = c + di$, and do some calculation. ■

Corollary 5.7.1.

$$\left| \sum_{i=1}^n z_i \right| \leq \sum_{i=1}^n |z_i| \quad \text{if } z_1, z_2, \dots, z_n \in \mathbb{C}.$$

On \mathbb{C} , we can introduce a metric $d(z, w) = |z - w|$ for $z, w \in \mathbb{C}$. Hence, if $z = a + bi$ and $w = c + di$, then $z \simeq (a, b) \in \mathbb{R}^2$ and $w \simeq (c, d) \in \mathbb{R}^2$, and thus

$$d(z, w) = d_{\mathbb{R}^2}(z, w),$$

so d is a metric on \mathbb{C} .

Definition 5.7.2. We say

$$\lim_{n \rightarrow \infty} z_n = z$$

if and only if $\lim_{n \rightarrow \infty} d(z_n, z) = \lim_{n \rightarrow \infty} |z_n - z| = 0$ for $z, z_n \in \mathbb{C}$.

Remark 5.7.2. \mathbb{C} is a complete metric space since \mathbb{R}^2 is complete.

Definition 5.7.3. If $z \in \mathbb{C}$, then we can define $\exp(z)$ by the power series

$$\exp(z) := \sum_{n=0}^{\infty} \frac{z^n}{n!}.$$

To show this definition is well-defined, we need to show $\lim_{n \rightarrow \infty} S_n$ exists where $S_n = \sum_{k=0}^n \frac{z^k}{k!}$. WLOG, suppose $n > m$, then

$$d(S_n, S_m) = |S_n - S_m| = \left| \sum_{k=m+1}^n \left(\frac{z^k}{k!} \right) \right| \leq \sum_{k=m+1}^n \left| \frac{z^k}{k!} \right| = \sum_{k=m+1}^n \frac{|z|^k}{k!}.$$

Recall that

$$\exp(|z|) = \sum_{n=0}^{\infty} \frac{|z|^n}{n!}$$

is well-defined for all $z \in \mathbb{C}$ since $|z| \in \mathbb{R}$. Now let $T_n = \sum_{k=0}^n \frac{|z|^k}{k!}$, then

$$d(S_n, S_m) \leq |T_n - T_m| \rightarrow 0 \text{ as } n, m \rightarrow \infty.$$

We also have the following properties:

- (1) $\exp(z + w) = \exp(z) \cdot \exp(w)$ for $z, w \in \mathbb{C}$.
- (2) $\exp(\bar{z}) = \overline{\exp(z)}$.

In the real case, \exp is a function from \mathbb{R} to $(0, \infty)$ and is injective. However, $\exp : \mathbb{C} \rightarrow \mathbb{C} \setminus \{0\}$ is not injective. Note that

$$\exp(z + 2\pi i) = \exp(z) \exp(2\pi i) = \exp(z) (\cos(2\pi) + i \sin(2\pi)) = \exp(z).$$

It's more complicated to define the inverse of $\exp(z)$.

5.8 Trigonometric functions

Definition 5.8.1. If $z \in \mathbb{C}$, then we define

$$\cos(z) = \frac{e^{iz} + e^{-iz}}{2}, \quad \sin(z) = \frac{e^{iz} - e^{-iz}}{2i}.$$

Proposition 5.8.1. For $z \in \mathbb{C}$,

$$e^{iz} = \cos(z) + i \sin(z), \quad e^{-iz} = \cos(z) - i \sin(z).$$

Proof. It can be shown by

$$\begin{aligned} \cos z + i \sin z &= \frac{e^{iz} + e^{-iz}}{2} + i \left(\frac{e^{iz} - e^{-iz}}{2i} \right) = e^{iz} \\ \cos(z) - i \sin z &= \frac{e^{iz} + e^{-iz}}{2} - i \left(\frac{e^{iz} - e^{-iz}}{2i} \right) = e^{-iz} \end{aligned}$$

■

Theorem 5.8.1.

$$\cos(z) = \sum_{n=0}^{\infty} \frac{(-1)^n z^{2n}}{(2n)!}$$

$$\sin(z) = \sum_{n=0}^{\infty} \frac{(-1)^n z^{2n+1}}{(2n+1)!}$$

for $z \in \mathbb{C}$.

Proof. Recall $e^z = \sum_{n=0}^{\infty} \frac{z^n}{n!}$ for $z \in \mathbb{C}$. Hence,

$$e^{iz} = \sum_{n=0}^{\infty} \frac{(iz)^n}{n!} = \sum_{k=0}^{\infty} \frac{(iz)^{2k}}{(2k)!} + \sum_{k=0}^{\infty} \frac{(iz)^{2k+1}}{(2k+1)!} = \sum_{k=0}^{\infty} \frac{(-1)^k z^{2k}}{(2k)!} + i \left(\sum_{k=0}^{\infty} \frac{(-1)^k z^{2k+1}}{(2k+1)!} \right)$$

$$e^{-iz} = e^{i(-z)} = \sum_{k=0}^{\infty} \frac{(-1)^k z^{2k}}{(2k)!} - i \left(\sum_{k=0}^{\infty} \frac{(-1)^k z^{2k+1}}{(2k+1)!} \right).$$

Thus,

$$\cos(z) = \frac{e^{iz} + e^{-iz}}{2} = \sum_{k=0}^{\infty} \frac{(-1)^k z^{2k}}{(2k)!}, \quad \sin(z) = \frac{e^{iz} - e^{-iz}}{2i} = \sum_{k=0}^{\infty} \frac{(-1)^k z^{2k+1}}{(2k+1)!}.$$

■

Remark 5.8.1. In particular, if $x \in \mathbb{R}$, then

$$\cos(x) = \frac{e^{ix} + e^{-ix}}{2} = \sum_{k=0}^{\infty} \frac{(-1)^k x^{2k}}{(2k)!}, \quad \sin(x) = \frac{e^{ix} - e^{-ix}}{2i} = \sum_{k=0}^{\infty} \frac{(-1)^k x^{2k+1}}{(2k+1)!}.$$

Theorem 5.8.2 (Trigonometric Identities). Let $x, y \in \mathbb{R}$. Then the following properties hold:

- (a) $\frac{d}{dx} \sin(x) = \cos(x)$, and $\frac{d}{dx} \cos(x) = -\sin(x)$.
- (b) $\sin^2(x) + \cos^2(x) = 1$. In particular, $\sin(x) \in [-1, 1]$ and $\cos(x) \in [-1, 1]$.
- (c) $\sin(-x) = -\sin(x)$, and $\cos(-x) = \cos(x)$.
- (d) $\cos(x+y) = \cos(x)\cos(y) - \sin(x)\sin(y)$, and $\sin(x+y) = \sin(x)\cos(y) + \cos(x)\sin(y)$.
- (e) $\sin(0) = 0$ and $\cos(0) = 1$.
- (f) $e^{ix} = \cos(x) + i\sin(x)$, and $e^{-ix} = \cos(x) - i\sin(x)$.

proof of (a).

$$\begin{aligned} \frac{d}{dx} \cos(x) &= \frac{d}{dx} \left(\frac{e^{ix} + e^{-ix}}{2} \right) = \frac{1}{2} (e^{ix} \cdot (ix)' + e^{-ix} \cdot (-ix)') \\ &= \frac{1}{2} (e^{ix} \cdot i + e^{-ix} \cdot (-i)) = \frac{i}{2} (e^{ix} - e^{-ix}) = \frac{i^2 (e^{ix} - e^{-ix})}{2i} = -\sin x. \end{aligned}$$

$$\begin{aligned} \frac{d}{dx} \sin x &= \frac{d}{dx} \left(\frac{e^{ix} - e^{-ix}}{2i} \right) = \frac{1}{2i} (e^{ix} \cdot i - e^{-ix} \cdot (-i)) \\ &= \frac{i}{2i} (e^{ix} + e^{-ix}) = \frac{1}{2} (e^{ix} + e^{-ix}) = \cos(x). \end{aligned}$$

■

proof of (b). Since

$$\begin{aligned}\frac{d}{dx}(\sin^2(x) + \cos^2(x)) &= 2\sin(x)(\sin(x))' + 2\cos(x)(\cos(x))' \\ &= 2\sin(x)\cos(x) + 2\cos(x)(-\sin(x)) = 0,\end{aligned}$$

and $\sin^2(0) + \cos^2(0) = 1$, so we know $\sin^2(x) + \cos^2(x) = 1$ for all $x \in \mathbb{R}$. ■

proof of (c). ■

proof of (d). Since $e^{i(x+y)} = \cos(x+y) + i\sin(x+y)$, and

$$e^{i(x+y)} = e^{ix}e^{iy} = [\cos(x)\cos(y) - \sin(x)\sin(y)] + i[\sin(x)\cos(y) + \cos(x)\sin(y)],$$

so we're done. ■

proof of (e). ■

proof of (f). ■

DIY

DIY

DIY

Lemma 5.8.1. There exists a positive number x s.t. $\sin(x) = 0$.

Proof. Since $\sin(0) = 0$, and we know $\sin(x)$ is continuous and differentiable on \mathbb{R} , and $\frac{d}{dx}\sin(x) = \cos(x)$, so

$$\frac{d}{dx}\sin(x)|_{x=0} = \cos(0) = 1 > 0.$$

Hence, $\sin(x)$ is strictly increasing near 0. Thus, $\exists \delta > 0$ s.t. $\sin(x) > 0$ on $(0, \delta]$. Suppose $\sin(x) \neq 0$ for all $x > 0$, then $\sin(x) > 0$ for all $x > 0$. We will show that this is impossible.

- Step 1: $\cos(x) \neq 0$ on $(0, \infty)$. Since we know

$$\sin(2x) = 2\sin(x)\cos(x),$$

so if $\cos(x_0) = 0$ for some $x_0 > 0$, then $\sin(2x_0) = 0$, which is a contradiction.

- Step 2: $\cos(x) > 0$ on $(0, \infty)$. Since $\cos(0) = 1 > 0$, and $\cos(x) \neq 0$ on $(0, \infty)$, and since $\cos(x)$ is continuous, so $\cos(x) > 0$ on $(0, \infty)$.
- Step 3: $\sin(x) > 0$ for all $x > 0$.
- Step 4: $\cot(x) = \frac{\cos(x)}{\sin(x)} > 0$ on $(0, \infty)$.
- Step 5:

$$\frac{d}{dx}\cot(x) = \frac{d}{dx}\left(\frac{\cos(x)}{\sin(x)}\right) = \frac{-\sin(x)\sin(x) - \cos(x)\cos(x)}{\sin^2(x)} = -\frac{1}{\sin^2(x)} < 0.$$

Since $\sin(x) > 0$ and $\sin(x) \in [-1, 1]$, and we know $0 < \sin(x) \leq 1$ when $x > 0$, which means $0 < \sin^2(x) \leq 1$, and this gives

$$\frac{d}{dx}\cot(x) = -\frac{1}{\sin^2(x)} \leq -1.$$

Note that

$$\begin{aligned}\cot(x+s) - \cot(x) &= \int_x^{x+s} \frac{d}{dt}\cot(t) dt = \int_x^{x+s} -\frac{1}{\sin^2(t)} dt \\ &\leq \int_x^{x+s} (-1) dt = -s.\end{aligned}$$

Hence, we have

$$\cot(x+s) - \cot(x) \leq -s \text{ when } s > 0, x > 0,$$

and this gives

$$\cot(x+s) \leq \cot(x) - s \text{ when } s > 0, x > 0,$$

Note that

$$\lim_{s \rightarrow \infty} \cot(x) - s = -\infty$$

since $\cot(x)$ is fixed. Hence,

$$\lim_{s \rightarrow \infty} \cot(x+s) = -\infty,$$

which means $\cot(x) < 0$ when x is big enough, which is a contradiction. ■

Lecture 22

Definition 5.8.2. We define π to be the smallest positive zero(零根) of $\sin(x)$, i.e.

$$\pi := \inf \{x \in (0, \infty) : \sin(x) = 0\}.$$

Hence, $\sin(x) > 0$ on $(0, \pi)$ since $\sin(x)$ is increasing near 0 and continuous.

By definition, $\sin(\pi) = 0$ and $\sin^2(\pi) + \cos^2(\pi) = 1$, so $\cos \pi = \pm 1$. However,

$$\frac{d}{dx} \cos(x) = -\sin(x) < 0$$

on $(0, \pi)$, so $\cos(x)$ is decreasing on $(0, \pi)$, and since $\cos(0) = 1$, so we know $\cos(\pi) = -1$.

Proposition 5.8.2. $\sin\left(\frac{\pi}{2}\right) = 1$ and $\cos\left(\frac{\pi}{2}\right) = 0$.

Proof. We know $\cos(\pi) = -1$, and since

$$\cos(\pi - x) = \cos(\pi) \cos(x) + \sin(\pi) \sin(x) = -\cos(x),$$

so by plugging $x = \frac{\pi}{2}$ we know $\cos\left(\frac{\pi}{2}\right) = -\cos\left(\frac{\pi}{2}\right)$, so $\cos\left(\frac{\pi}{2}\right) = 0$. Also, since

$$\sin^2\left(\frac{\pi}{2}\right) + \cos^2\left(\frac{\pi}{2}\right) = 1,$$

so $\sin\left(\frac{\pi}{2}\right) = \pm 1$. Since $\sin(x) > 0$ on $(0, \pi)$, so $\sin\left(\frac{\pi}{2}\right) = 1$. ■

Theorem 5.8.3. Let $x \in \mathbb{R}$. Then $\sin(x)$ and $\cos(x)$ has the following properties:

(1)

$$\begin{aligned} \cos(x+\pi) &= -\cos(x), & \sin(x+\pi) &= -\sin(x) \\ \cos(x+2\pi) &= \cos(x), & \sin(x+2\pi) &= \sin(x). \end{aligned}$$

(2) $\sin(x) = 0$ iff $\frac{x}{\pi} \in \mathbb{Z}$, i.e. $x = k\pi$ for $k \in \mathbb{Z}$.

(3) $\cos(x) = 0$ iff $\frac{x}{\pi} = k + \frac{1}{2}$ where $k \in \mathbb{Z}$, i.e. $x = \left(k + \frac{1}{2}\right)\pi$ for $k \in \mathbb{Z}$.

proof of (1). Note that

$$\begin{aligned} \cos(x+\pi) &= \cos(x) \cos(\pi) - \sin(x) \sin(\pi) = -\cos(x) \\ \sin(x+\pi) &= \sin(x) \cos(\pi) + \sin(\pi) \cos(x) = -\sin(x). \end{aligned}$$

Also, we have

$$\begin{aligned}\cos(x + 2\pi) &= \cos((x + \pi) + \pi) = -\cos(x + \pi) = (-1) \cdot (-1) \cdot \cos(x) = \cos(x) \\ \sin(x + 2\pi) &= \sin((x + \pi) + \pi) = -\sin(x + \pi) = (-1) \cdot (-1) \cdot \sin(x) = \sin(x).\end{aligned}$$

■

Chapter 6

Fourier series

In the previous two chapters, we discussed the issue of how certain functions (for instance, compactly supported continuous functions) could be approximated by polynomials. Later, we showed how a different class of functions (real analytic functions) could be written exactly (not approximately) as an infinite polynomial, or more precisely a power series. Power series are already immensely useful, especially when dealing with special functions such as the exponential and trigonometric functions discussed earlier. However, there are some circumstances where power series are not so useful, because one has to deal with functions (e.g. \sqrt{x}) which are not real analytic, and so do not have power series. Fortunately, there is another type of series expansion, known as Fourier series, which is also a very powerful tool in analysis (though used for slightly different purposes). Instead of analyzing compactly supported functions, it instead analyzes periodic functions; instead of decomposing into polynomials, it decomposes into trigonometric polynomials. Roughly speaking, the theory of Fourier series asserts that just about every periodic function can be decomposed as an (infinite) sum of sines and cosines.

Definition 6.0.1. Let $L > 0$ and $L \in \mathbb{R}$. A complex function $f : \mathbb{R} \rightarrow \mathbb{C}$ is L -periodic if $f(x + L) = f(x)$ for all $x \in \mathbb{R}$.

Remark 6.0.1. $f(x + L) = f(x)$ for all x implies $f(x + kL) = f(x)$ for all $k \in \mathbb{Z}$.

Example 6.0.1. For any integer $n \in \mathbb{Z}$, $\cos(2\pi nx)$, $\sin(2\pi nx)$, and

$$e^{2\pi i n x} = \cos(2\pi nx) + i \sin(2\pi nx)$$

all has period 1.

Remark 6.0.2. A 1-periodic function is also called \mathbb{Z} -periodic since $f(x+1) = f(x)$ means $f(x+k) = f(x)$ for all $k \in \mathbb{Z}$.

Remark 6.0.3. If f is L -periodic, then $g(x) = f(Lx)$ is 1-periodic. Conversely, if $g(x)$ is 1-periodic, then $f(x) := g\left(\frac{x}{L}\right)$ is L -periodic.

Remark 6.0.4. Suppose f is \mathbb{Z} -periodic, then $f(x+1) = f(x)$ for all $x \in \mathbb{R}$. We regard f as functions on \mathbb{R}/\mathbb{Z} . Now we explain what is \mathbb{R}/\mathbb{Z} . On \mathbb{R} , we define $x \sim y$ iff $x - y \in \mathbb{Z}$, and \sim is an equivalence relation, so

$$[x] = \{x + k \mid k \in \mathbb{Z}\},$$

and thus

$$\mathbb{R}/\mathbb{Z} = \{[x] \mid x \in \mathbb{R}\} = \{[y] \mid y \in [0, 1)\}.$$

Hence, if f is \mathbb{Z} -periodic, then we can equivalently define f as

$$f : \mathbb{R}/\mathbb{Z} \rightarrow \mathbb{C}, \quad [y] \rightarrow f(y)$$

since $[y_1] = [y_2]$ iff $y_1 - y_2 = k \in \mathbb{Z}$ iff $f(y_1) = f(y_2 + k) = f(y_2)$.

Definition 6.0.2. The set of continuous complex-valued 1-periodic function on \mathbb{R}/\mathbb{Z} is denoted by $C(\mathbb{R}/\mathbb{Z}, \mathbb{C})$, i.e.

$$C(\mathbb{R}/\mathbb{Z}, \mathbb{C}) = \{f \mid f : \mathbb{R} \rightarrow \mathbb{C}, f \text{ is continuous}, f(x+1) = f(x) \quad \forall x \in \mathbb{R}\}.$$

Definition 6.0.3. Every function $f \in C(\mathbb{R}/\mathbb{Z}, \mathbb{C})$ can be written as

$$f(x) = f^1(x) + if^2(x)$$

where $f^1, f^2 \in C(\mathbb{R}/\mathbb{Z}, \mathbb{R})$, i.e. f^1, f^2 are real-valued and continuous and 1-periodic. Now for $f = f^1 + if^2$ and $g = g^1 + ig^2$ in $C(\mathbb{R}/\mathbb{Z}, \mathbb{C})$, we define

$$d_\infty(f, g) = \sup_{x \in \mathbb{R}} |f(x) - g(x)| = \sup_{x \in [0,1]} |f(x) - g(x)| = \sup_{x \in [0,1]} \sqrt{(f^1(x) - g^1(x))^2 + (f^2(x) - g^2(x))^2},$$

and we know d_∞ define a metric on $C(\mathbb{R}/\mathbb{Z}, \mathbb{C})$.

Definition 6.0.4. We say $f_n \rightarrow f$ uniformly on $C(\mathbb{R}/\mathbb{Z}, \mathbb{C})$ iff $\lim_{n \rightarrow \infty} d_\infty(f_n, f) = 0$.

Theorem 6.0.1. On $C(\mathbb{R}/\mathbb{Z}, \mathbb{C})$, TFAE:

- (a) $d_\infty(f_n, f) \rightarrow 0$ as $n \rightarrow \infty$.
- (b) $f_n \rightarrow f$ uniformly on \mathbb{R} .
- (c) $f_n \rightarrow f$ uniformly on $[0, 1]$.
- (d) $\text{Re}(f_n) \rightarrow \text{Re}(f)$ uniformly and $\text{Im}(f_n) \rightarrow \text{Im}(f)$ uniformly.

Lemma 6.0.1. The following properties hold on $C(\mathbb{R}/\mathbb{Z}, \mathbb{C})$:

- (a) If $f \in C(\mathbb{R}/\mathbb{Z}, \mathbb{C})$, then f is bounded, i.e. $\exists M > 0$ s.t. $|f(x)| \leq M$ for all $x \in \mathbb{R}$.
- (b) If $f, g \in C(\mathbb{R}/\mathbb{Z}, \mathbb{C})$, then $f + g, f - g$, and $f \cdot g \in C(\mathbb{R}/\mathbb{Z}, \mathbb{C})$. Also, for any $c \in \mathbb{C}$, $c \cdot f \in C(\mathbb{R}/\mathbb{Z}, \mathbb{C})$. This implies that $C(\mathbb{R}/\mathbb{Z}, \mathbb{C})$ is a vector space over \mathbb{C} and commutative algebra.
- (c) If $\{f_n\}_{n=1}^\infty$ with $f_n \in C(\mathbb{R}/\mathbb{Z}, \mathbb{C})$ and $\lim_{n \rightarrow \infty} d_\infty(f_n, f) = 0$, then $f \in C(\mathbb{R}/\mathbb{Z}, \mathbb{C})$. This implies that $(C(\mathbb{R}/\mathbb{Z}, \mathbb{C}), d_\infty)$ is a complete metric space.

proof of (a). Let

$$f(x) = f^1(x) + if^2(x)$$

where $f^1, f^2 : \mathbb{R} \rightarrow \mathbb{R}$ and continuous and 1-periodic, then since

$$\sup_{x \in \mathbb{R}} f^1(x) = \sup_{x \in [0,1]} f^1(x)$$

and f^1 is continuous on $[0, 1]$, so there exists M_1 s.t. $|f^1(x)| \leq M_1$ for all $x \in [0, 1]$. Similarly, we can show there exists M_2 s.t. $|f^2(x)| \leq M_2$ for all $x \in [0, 1]$ and thus

$$|f(x)| = |f^1(x) + if^2(x)| = \sqrt{(f^1(x))^2 + (f^2(x))^2} \leq \sqrt{M_1^2 + M_2^2},$$

so $\sup_{x \in \mathbb{R}} |f(x)| \leq \sqrt{M_1^2 + M_2^2}$. ■

proof of (b). ■

proof of (c). Note that

$$\begin{aligned} |f(x+1) - f(x)| &= |f(x+1) - f_n(x+1) + f_n(x+1) - f_n(x) + f_n(x) - f(x)| \\ &\leq |f(x+1) - f_n(x+1)| + |f_n(x+1) - f_n(x)| + |f_n(x) - f(x)| \\ &\rightarrow 0 + 0 + 0 = 0 \text{ as } n \rightarrow \infty. \end{aligned}$$

This means $f(x+1) = f(x)$ since $|f(x+1) - f(x)|$ can be arbitrarily small. Note that f is continuous since $f_n \rightarrow f$ uniformly and uniform convergence preserve the continuity. ■

DIY

6.1 Inner Products on Periodic functions

Definition 6.1.1. If $f, g \in C(\mathbb{R}/\mathbb{Z}, \mathbb{C})$, then we define their inner product by

$$\langle f, g \rangle = \int_0^1 f(x) \overline{g(x)} \, dx,$$

and if we suppose $f = f^1 + if^2$ and $g = g^1 + ig^2$ for $f^1, f^2, g^1, g^2 \in C(\mathbb{R}/\mathbb{Z}, \mathbb{R})$, then

$$\int_0^1 f(x) \cdot \overline{g(x)} \, dx = \int_0^1 (f^1 g^1 + f^2 g^2) \, dx + i \int_0^1 (f^2 g^1 - f^1 g^2) \, dx.$$

Example 6.1.1. If $f(x) = 1$ and $g(x) = e^{2\pi i x}$, then

$$\langle f, g \rangle = \int_0^1 1 \cdot \overline{(e^{2\pi i x})} \, dx = \int_0^1 1 \cdot e^{-2\pi i x} \, dx = \left. \frac{e^{-2\pi i x}}{-2\pi i} \right|_0^1 = \frac{1-1}{-2\pi i} = 0,$$

so $f \perp g$.

Lemma 6.1.1. Let $f, g, h \in C(\mathbb{R}/\mathbb{Z}, \mathbb{C})$, then

- (1) $\langle f, g \rangle = \overline{\langle g, f \rangle}$.
- (2) $\langle f, f \rangle \geq 0$, and $\langle f, f \rangle = 0$ iff $f = 0$.
- (3) $\langle f + g, h \rangle = \langle f, h \rangle + \langle g, h \rangle$, and $\langle cf, g \rangle = c\langle f, g \rangle$ for all $c \in \mathbb{C}$.
- (4) $\langle f, g + h \rangle = \langle f, g \rangle + \langle f, h \rangle$, and $\langle f, cg \rangle = \bar{c}\langle f, g \rangle$ for all $c \in \mathbb{C}$.

Definition 6.1.2. We define the L^2 norm of f to be

$$\|f\|_2 = \sqrt{\langle f, f \rangle} = \sqrt{\int_0^1 |f(x)|^2 \, dx}.$$

Lemma 6.1.2. If $f, g \in C(\mathbb{R}/\mathbb{Z}, \mathbb{C})$, then we have

- (a) $\|f\|_2 = 0$ iff $f = 0$.
- (b) $|\langle f, g \rangle| \leq \|f\|_2 \|g\|_2$.
- (c) $\|f + g\|_2 \leq \|f\|_2 + \|g\|_2$.
- (d) If $\langle f, g \rangle = 0$, then $\|f + g\|_2^2 = \|f\|_2^2 + \|g\|_2^2$.

(e) If $c \in \mathbb{C}$, then $\|cf\|_2 = |c|\|f\|_2$.

proof of (a). Since

$$\|f\|_2 = 0 \Leftrightarrow \int_0^1 |f(x)|^2 dx = 0,$$

and since $|f(x)|^2$ is continuous and $|f(x)|^2 \geq 0$, so $\int_0^1 |f(x)|^2 dx = 0$ if and only if $|f(x)|^2 = 0$ for all $x \in [0, 1]$ if and only if $f(x) = 0$ for all $x \in [0, 1]$. ■

proof of (b). First, we prove the real case. Let $u, v \in C([0, 1], \mathbb{R})$. We want to show that

$$\left| \int_0^1 u(x)v(x) dx \right| \leq \left(\int_0^1 u^2(x) dx \right)^{\frac{1}{2}} \cdot \left(\int_0^1 v^2(x) dx \right)^{\frac{1}{2}}.$$

For any real number λ ,

$$\int_0^1 (u(x) - \lambda v(x))^2 dx \geq 0,$$

and we have

$$\int_0^1 (u^2(x) - 2\lambda u(x)v(x) + \lambda^2 v^2(x)) dx = \int_0^1 u^2(x) dx - 2\lambda \left(\int_0^1 u(x)v(x) dx \right) + \lambda^2 \left(\int_0^1 v^2(x) dx \right),$$

so

$$\lambda^2 \left(\int_0^1 v^2(x) dx \right) - 2\lambda \left(\int_0^1 u(x)v(x) dx \right) + \int_0^1 u^2(x) dx \geq 0 \text{ for all } \lambda.$$

- Case 1: $\int_0^1 v^2(x) dx = 0$, then $v(x) = 0$, so

$$0 = \int_0^1 u(x)v(x) dx \leq \left(\int_0^1 u^2(x) dx \right)^{\frac{1}{2}} \cdot 0 = 0.$$

- Case 2: $\int_0^1 v^2(x) dx > 0$, then the minimum of

$$G(\lambda) = \lambda^2 \overbrace{\left(\int_0^1 v^2(x) dx \right)}^C - 2\lambda \overbrace{\left(\int_0^1 u(x)v(x) dx \right)}^B + \overbrace{\left(\int_0^1 u^2(x) dx \right)}^A$$

is at $\lambda = \frac{B}{C}$ ($G'(\lambda) = 0$) with minimum

$$\left(\frac{B}{C} \right)^2 C - 2 \frac{B}{C} B + A = \frac{-B^2 + AC}{C} = \int_0^1 (u(x) - \lambda v(x))^2 dx \geq 0.$$

Now since $C = \int_0^1 v^2(x) dx > 0$, so $-B^2 + AC \geq 0$, and thus $B^2 \leq AC$, i.e.

$$\left| \int_0^1 u(x)v(x) dx \right| \leq \left(\int_0^1 u^2(x) dx \right)^{\frac{1}{2}} \cdot \left(\int_0^1 v^2(x) dx \right)^{\frac{1}{2}}.$$

Now, we first show that

$$\left| \int_0^1 f(x) dx \right| \leq \int_0^1 |f(x)| dx.$$

Let $I = \int_0^1 f(x) dx \in \mathbb{C}$. If $I = 0$, then this is true. If $I \neq 0$, then let $c = \frac{\bar{I}}{|I|} \in \mathbb{C}$, so we have

$$cI = \frac{\bar{I}}{|I|} I = |I| \in \mathbb{R}.$$

Now

$$cI = c \int_0^1 f(x) dx = \int_0^1 cf(x) dx = \int_0^1 \operatorname{Re}(cf(x)) dx + i \int_0^1 \operatorname{Im}(cf(x)) dx = \int_0^1 \operatorname{Re}(cf(x)) dx \in \mathbb{R}.$$

So

$$|I| = cI = \int_0^1 \operatorname{Re}(cf(x)) dx \leq \int_0^1 |cf(x)| dx = |c| \int_0^1 |f(x)| dx = \int_0^1 |f(x)| dx$$

since $|c| = 1$, and thus

$$\left| \int_0^1 f(x) dx \right| = |I| \leq \int_0^1 |f(x)| dx.$$

Hence, we finally have

$$\begin{aligned} \left| \int_0^1 f(x) \overline{g(x)} dx \right| &\leq \int_0^1 |f(x) \overline{g(x)}| dx = \int_0^1 |f(x)| |\overline{g(x)}| dx \\ &= \int_0^1 |f(x)| |g(x)| dx \leq \left(\int_0^1 |f(x)|^2 dx \right)^{\frac{1}{2}} \left(\int_0^1 |g(x)|^2 dx \right)^{\frac{1}{2}} \end{aligned}$$

since we convert the complex case to the real case. ■

proof of (c). Since

$$\begin{aligned} \|f + g\|_2^2 &= \langle f + g, f + g \rangle = \langle f, f + g \rangle + \langle g, f + g \rangle \\ &= \langle f, f \rangle + \langle f, g \rangle + \langle g, f \rangle + \langle g, g \rangle \\ &= \langle f, f \rangle + \langle f, g \rangle + \overline{\langle f, g \rangle} + \langle g, g \rangle \\ &= \langle f, f \rangle + 2\operatorname{Re}\langle f, g \rangle + \langle g, g \rangle \\ &\leq \langle f, f \rangle + 2|\langle f, g \rangle| + \langle g, g \rangle \\ &\leq \langle f, f \rangle + 2\|f\|_2\|g\|_2 + \langle g, g \rangle \\ &= \|f\|_2^2 + 2\|f\|_2\|g\|_2 + \|g\|_2^2 = (\|f\|_2 + \|g\|_2)^2, \end{aligned}$$

so we have

$$\|f + g\|_2 \leq \|f\|_2 + \|g\|_2. \quad \blacksquare$$

proof of (d). Since

$$\|f + g\|_2^2 = \|f\|_2^2 + \|g\|_2^2 + \langle f, g \rangle + \overline{\langle f, g \rangle},$$

so $\langle f, g \rangle = 0$ implies

$$\|f + g\|_2 = \|f\|_2 + \|g\|_2. \quad \blacksquare$$

proof of (e). ■

DIY

Lecture 23

On $C(\mathbb{R}/\mathbb{Z}, \mathbb{C})$, we can use L^2 norm to define a metric on $C(\mathbb{R}/\mathbb{Z}, \mathbb{C})$:

$$d_2(f, g) = \|f - g\|_2,$$

but this metric is not complete. See [Appendix C.1](#).

25 Nov. 09:10

6.2 Trigonometric polynomials

In the preceding section we introduced an inner product on the space $C(\mathbb{R}/\mathbb{Z}, \mathbb{C})$ of continuous 1-periodic complex-valued functions. We now use this inner product to develop the theory of trigonometric polynomials, which play for Fourier series the same role that ordinary polynomials play for power series. The basic building blocks will be the complex exponentials $e^{2\pi i n x}$, also called characters.

Definition 6.2.1. For each $n \in \mathbb{Z}$, define the function $e_n \in C(\mathbb{R}/\mathbb{Z}, \mathbb{C})$ by

$$e_n(x) = e^{2\pi i n x},$$

then we know $e_n(x+1) = e_n(x)$ for all $x \in \mathbb{R}$. Sometimes we call e_n the character of frequency n .

Definition 6.2.2. A function $f \in C(\mathbb{R}/\mathbb{Z}, \mathbb{C})$ is called trigonometric polynomial if it can be written in the form

$$f(x) = \sum_{n=-N}^N c_n e_n(x)$$

for some integer $N \geq 0$.

Remark 6.2.1.

$$\begin{aligned} \cos(2\pi n x) &= \frac{e^{2\pi i n x} + e^{-2\pi i n x}}{2} = \frac{e_n(x) + e_{-n}(x)}{2} \\ \sin(2\pi n x) &= \frac{e^{2\pi i n x} - e^{-2\pi i n x}}{2i} = \frac{e_n(x) - e_{-n}(x)}{2i}, \end{aligned}$$

so the (complex) linear combination of $\cos(2\pi n x)$ and $\sin(2\pi n x)$ is also a trigonometric polynomial.

Lemma 6.2.1. Let $n, m \in \mathbb{Z}$, then

$$\langle e_n, e_m \rangle = \delta_{nm} = \begin{cases} 1, & \text{if } n = m; \\ 0, & \text{if } n \neq m. \end{cases}$$

Proof. Since

$$\begin{aligned} \langle e_n, e_m \rangle &= \int_0^1 e_n(x) \overline{e_m(x)} dx = \int_0^1 e^{2\pi i n x} \overline{e^{2\pi i m x}} dx = \int_0^1 e^{2\pi i n x} e^{-2\pi i m x} dx \\ &= \int_0^1 e^{2\pi i x(n-m)} dx, \end{aligned}$$

and then

- Case 1: $n = m$, then

$$\langle e_n, e_m \rangle = \int_0^1 e^0 dx = \int_0^1 1 dx = 1.$$

- Case 2: $n \neq m$, then

$$\langle e_n, e_m \rangle = \frac{e^{2\pi i x(n-m)}}{2\pi i(n-m)} \Big|_0^1 = \frac{1-1}{2\pi i(n-m)} = 0$$

since for $n - m \in \mathbb{Z}$ we have $e^{2\pi i(n-m)} = 1$.

■

Corollary 6.2.1. Let $f = \sum_{n=-N}^N c_n e_n$, then $c_n = \langle f, e_n \rangle$ and

$$\|f\|_2^2 = \sum_{n=-N}^N |c_n|^2$$

Proof. Since

$$\langle f, e_n \rangle = \left\langle \sum_{k=-N}^N c_k e_k, e_n \right\rangle = \sum_{k=-N}^N c_k \langle e_k, e_n \rangle = c_n \langle e_n, e_n \rangle = c_n,$$

so

$$\begin{aligned} \|f\|_2^2 &= \langle f, f \rangle = \left\langle \sum_{k=-N}^N c_k e_k, \sum_{\ell=-N}^N c_\ell e_\ell \right\rangle \\ &= \sum_{\ell=-N}^N \sum_{k=-N}^N c_k \overline{c_\ell} \langle e_k, e_\ell \rangle = \sum_{\ell=-N}^N \sum_{k=-N}^N c_k \overline{c_\ell} \delta_{k\ell} = \sum_{\ell=-N}^N c_\ell \overline{c_\ell} = \sum_{\ell=-N}^N |c_\ell|^2. \end{aligned}$$

■

Later, we'll show that if $f \in C(\mathbb{R}/\mathbb{Z}, \mathbb{C})$, then

$$\|f\|_2^2 = \sum_{n \in \mathbb{Z}} |\langle f, e_n \rangle|^2.$$

6.3 Periodic convolutions

We want to prove the following theorem:

Theorem 6.3.1. Let $f \in C(\mathbb{R}/\mathbb{Z}, \mathbb{C})$, and let $\varepsilon > 0$, then \exists a trigonometric polynomial P s.t.

$$\|f - P\|_\infty < \varepsilon.$$

Definition 6.3.1. Let $f, g \in C(\mathbb{R}/\mathbb{Z}, \mathbb{C})$, then we define their periodic convolution $f * g : \mathbb{R} \rightarrow \mathbb{C}$ by

$$(f * g)(x) = \int_0^1 f(y)g(x - y) dy.$$

We first show the below two propositions, which will be useful later.

Proposition 6.3.1. For $F \in C(\mathbb{R}/\mathbb{Z}, \mathbb{C})$. Viewing F a 1-periodic continuous function, then F is bounded and uniformly continuous.

Proof. We have shown boundedness in [Lemma 6.0.1](#). Now we show F is uniformly continuous.

- Step 1: Uniform continuity on $[0, 2]$. Since F is continuous on the compact interval $[0, 2]$, it is uniformly continuous there. Thus, for every $\varepsilon > 0$ there exists $\delta_0 > 0$ s.t.

$$u, v \in [0, 2], |u - v| < \delta_0 \Rightarrow |F(u) - F(v)| < \varepsilon. \quad (6.1)$$

Now we can define $\delta = \min\{\delta_0, \frac{1}{2}\}$, then [Equation 6.1](#) remains valid with δ in place of δ_0 :

$$u, v \in [0, 2], |u - v| < \delta \Rightarrow |F(u) - F(v)| < \varepsilon.$$

- Step 2: Extend uniform continuity to all of \mathbb{R} . Let $\varepsilon > 0$ to be fixed and choose δ as above. Take any $x, y \in \mathbb{R}$. We must show that

$$|F(x) - F(y)| < \varepsilon.$$

Claim 6.3.1. There exists an integer n s.t.

$$x, y \in [n, n + 2].$$

Proof. WLOG, assume $x \leq y$, then choose $n \in \mathbb{Z}$ s.t. $n \leq x < n+1$. Since $|x - y| = y - x < \frac{1}{2}$,

$$y < x + \frac{1}{2} < (n+1) + \frac{1}{2} = n + \frac{3}{2} < n+2.$$

Thus, $x, y \in [n, n+2]$. ⊗

Define $u := x - n$ and $v := y - n$, then $u, v \in [0, 2]$ and

$$|u - v| = |x - y| < \delta.$$

Hence, we know $|F(u) - F(v)| < \varepsilon$. Now by the 1-periodicity of F , we know

$$F(x) = F(u), \quad F(y) = F(v),$$

so

$$|F(x) - F(y)| = |F(u) - F(v)| < \varepsilon.$$

■

Proposition 6.3.2. Let $F : \mathbb{R} \rightarrow \mathbb{C}$ be a 1-periodic integrable function, then for any $a \in \mathbb{R}$ we have

$$\int_a^{a+1} F(x) \, dx = \int_0^1 F(x) \, dx \text{ for any } a \in \mathbb{R}.$$

Proof. Fix $a \in \mathbb{R}$. Choose $n \in \mathbb{Z}$ s.t. $n \leq a < n+1$ and set $r := a - n \in [0, 1)$. Then

$$\int_a^{a+1} F(x) \, dx = \int_{n+r}^{n+1+r} F(x) \, dx.$$

Make the change of variables $x = t + n$, so $dx = dt$ and

$$\int_{n+r}^{n+1+r} F(x) \, dx = \int_r^{r+1} F(t+n) \, dt.$$

Now since $F(t+n) = F(t)$ for all t , so

$$\int_r^{r+1} F(t+n) \, dt = \int_r^{r+1} F(t) \, dt.$$

We now show that

$$\int_r^{r+1} F(t) \, dt = \int_0^1 F(t) \, dt \quad (0 \leq r < 1).$$

Note that

$$\int_r^{r+1} F(t) \, dt = \int_r^1 F(t) \, dt + \int_1^{r+1} F(t) \, dt,$$

and in the second term, substitute $t = s + 1$, so

$$\int_1^{r+1} F(t) \, dt = \int_0^r F(s+1) \, ds = \int_0^r F(s) \, ds.$$

Hence,

$$\int_r^{r+1} F(t) \, dt = \int_r^1 F(t) \, dt + \int_0^r F(t) \, dt = \int_0^1 F(t) \, dt.$$

Thus, we are done. ■

We now list the key algebraic properties of periodic convolution. They resemble the properties of usual convolution, except that periodicity must be checked carefully.

Lemma 6.3.1. Let $f, g, h \in C(\mathbb{R}/\mathbb{Z}, \mathbb{C})$, then

- (Closure) $f * g \in C(\mathbb{R}/\mathbb{Z}, \mathbb{C})$.
- (Commutativity) $f * g = g * f$.
- (Bilinearity) $(f + g) * h = f * h + g * h$ and $f * (g + h) = f * g + f * h$ and

$$(cf) * g = f * (cg) = c(f * g).$$

proof of (a). Now consider

$$(f * g)(x) = \int_0^1 f(y)g(x - y) \, dy,$$

then since f is bounded and g is uniformly continuous, so given $\varepsilon > 0$ there exists $M > 0$ s.t. $|f(y)| \leq M$ and $\delta > 0$ s.t.

$$|s - t| < \delta \Rightarrow |g(s) - g(t)| < \frac{\varepsilon}{M}.$$

Also, we have

$$(f * g)(x) - (f * g)(x_0) = \int_0^1 f(y) (g(x - y) - g(x_0 - y)) \, dy,$$

so if $|x - x_0| < \delta$, then

$$|(x - y) - (x_0 - y)| = |x - x_0| < \delta,$$

which gives

$$|g(x - y) - g(x_0 - y)| < \frac{\varepsilon}{M}.$$

Thus,

$$|(f * g)(x) - (f * g)(x_0)| \leq \int_0^1 |f(y)| |g(x - y) - g(x_0 - y)| \, dy \leq \int_0^1 M \cdot \frac{\varepsilon}{M} \, dy = \varepsilon.$$

Thus, $f * g$ is continuous. Also, since $g(x + 1 - y) = g(x - y)$, so

$$(f * g)(x + 1) = \int_0^1 f(y)g(x + 1 - y) \, dy = \int_0^1 f(y)g(x - y) \, dy = (f * g)(x).$$

■

proof of (b). Since

$$\begin{aligned} (f * g)(x) &= \int_0^1 f(y)g(x - y) \, dy = - \int_x^{x-1} f(x - z)g(z) \, (dz) = \int_{x-1}^x f(x - z)g(z) \, dz \\ &= \int_0^1 f(x - z)g(z) \, dz = \int_0^1 g(z)f(x - z) \, dz = (g * f)(x), \end{aligned}$$

so we're done. ■

Theorem 6.3.2. Recall that $e_n(x) = e^{2\pi i n x}$, then for any $f \in C(\mathbb{R}/\mathbb{Z}, \mathbb{C})$, we have

$$f * e_n = \hat{f}(n)e_n$$

where

$$\hat{f}(n) = \int_0^1 f(y)e^{-2\pi i n y} \, dy = \langle f, e_n \rangle.$$

Proof.

$$\begin{aligned}
 (f * e_n)(x) &= \int_0^1 f(y) e_n(x-y) dy = \int_0^1 f(y) e^{2\pi i n(x-y)} dy \\
 &= \int_0^1 f(y) e^{2\pi i n x} \cdot e^{-2\pi i n y} dy = \left(\int_0^1 f(y) e^{-2\pi i n y} dy \right) e^{2\pi i n x} = \hat{f}(n) e_n(x).
 \end{aligned}$$

■

Theorem 6.3.3. Let $P = \sum_{n=-N}^N c_n e_n$, then

$$(f * P)(x) = \sum_{n=-N}^N c_n \hat{f}(n) e_n.$$

Proof.

$$\begin{aligned}
 (f * P)(x) &= \left(f * \left(\sum_{n=-N}^N c_n e_n \right) \right)(x) = \sum_{n=-N}^N c_n (f * e_n)(x) \\
 &= \sum_{n=-N}^N c_n \hat{f}(n) e_n.
 \end{aligned}$$

■

Lecture 24

Our goal is to prove

2 Dec. 10:20

Theorem 6.3.4 (Weierstrass Approximation Theorem by trigonometric polynomial). Let $f \in C(\mathbb{R}/\mathbb{Z}, \mathbb{C})$ be continuous 1-periodic function, and let $\varepsilon > 0$. Then there exists a trigonometric polynomial $P \in C(\mathbb{R}/\mathbb{Z}, \mathbb{C})$ s.t.

$$\|f - P\|_\infty \leq \varepsilon \text{ where } |f - P|_\infty = \sup_{x \in [0,1]} |f(x) - P(x)|.$$

This implies the set of trigonometric polynomial is dense in $C(\mathbb{R}/\mathbb{Z}, \mathbb{C})$ w.r.t. $\|\cdot\|_\infty$.

Definition 6.3.2. Let $\varepsilon > 0$ and $0 < \delta < \frac{1}{2}$. A function $f \in C(\mathbb{R}/\mathbb{Z}, \mathbb{C})$ is a periodic (ε, δ) approximation to the identity if the following two conditions holds:

- (a) $f(x) \geq 0$ for all $x \in \mathbb{R}$ and $\int_0^1 f(x) dx = 1$.
- (b) For all $\delta \leq |x| \leq 1 - \delta$, one has $f(x) < \varepsilon$.

Figure 6.1: A (ε, δ) approximation to the identity

Lemma 6.3.2 (Periodic approximation to the identity). Let $\varepsilon > 0$ and $0 < \delta < \frac{1}{2}$. Then there exists a trigonometric polynomial P which is a periodic (ε, δ) approximation to the identity, that is, $P \in C(\mathbb{R}/\mathbb{Z}, \mathbb{C})$, $P(x) \geq 0$ for all $x \in \mathbb{R}$, and $\int_0^1 P(x) dx = 1$, and $P(x) < \varepsilon$ for all $\delta \leq |x| \leq 1 - \delta$.

Proof. If we can prove the below claim, then we can show this lemma.

Claim 6.3.2. We can choose N large enough s.t.

$$F_N(x) = \frac{1}{N} \left| \sum_{k=0}^{N-1} e_k(x) \right|^2 \quad \text{where } e_k(x) = e^{2\pi i k x}$$

and we can pick P to be this $F_N(x)$ with enough large N .

The geometric meaning is that

$$\{e_0(x), \dots, e_{N-1}(x)\}$$

is an orthonormal set w.r.t. L_2 -inner product, which has been shown before. Now

$$v(x) = \frac{1}{\sqrt{N}} \sum_{i=0}^{N-1} e_i(x)$$

is a unit vector under L_2 -inner product, so we know

$$\int_0^1 \frac{1}{N} \left| \sum_{k=0}^{N-1} e_k(x) \right|^2 dx = \int_0^1 v(x) \overline{v(x)} dx = \|v(x)\|_2^2 = 1.$$

Claim 6.3.3.

$$F_N(x) = \sum_{n=-N}^N \left(1 - \frac{|n|}{N}\right) e_n(x) \quad \text{where } e_n(x) = e^{2\pi i n x}.$$

Proof. Note that

$$F_N(x) = \sum_{n=-(N-1)}^{N-1} \left(1 - \frac{|n|}{N}\right) e_n(x).$$

Recall that

$$\begin{aligned} F_N(x) &= \frac{1}{N} \left| \sum_{k=0}^{N-1} e_k(x) \right|^2 = \frac{1}{N} \left(\sum_{k=0}^{N-1} e_k(x) \right) \overline{\left(\sum_{\ell=0}^{N-1} e_\ell(x) \right)} = \frac{1}{N} \left(\sum_{k=0}^{N-1} e_k(x) \right) \left(\sum_{\ell=0}^{N-1} \overline{e_\ell(x)} \right) \\ &= \frac{1}{N} \sum_{k=0}^{N-1} \sum_{\ell=0}^{N-1} e_k(x) \overline{e_\ell(x)} = \frac{1}{N} \sum_{k=0}^{N-1} \sum_{\ell=0}^{N-1} e_{k-\ell}(x). \end{aligned}$$

Note that

$$\begin{cases} 0 \leq k \leq N-1 \\ 0 \leq \ell \leq N-1 \end{cases} \Rightarrow -(N-1) \leq k-\ell \leq N-1.$$

Now fix $m = k - \ell$, then we can count that there are $N - |m|$ (k_1, ℓ_1) pairs s.t. $k_1 - \ell_1 = m$. Hence, we know

$$F_N(x) = \frac{1}{N} \sum_{k=0}^{N-1} \sum_{\ell=0}^{N-1} e_{k-\ell}(x) = \frac{1}{N} \sum_{m=-(N-1)}^{N-1} (N - |m|) e_m(x) = \sum_{m=-(N-1)}^{N-1} \left(1 - \frac{|m|}{N}\right) e_m(x).$$

⊗

Now we already know $F_N(x) \geq 0$ and $\int_0^1 F_N(x) dx = 1$, and we know $F_N(x)$ is a trigonometric polynomial, so $F_N(x) \in C(\mathbb{R}/\mathbb{Z}, \mathbb{C})$.

Now we simplify F_N . Note that if $x \notin \mathbb{Z}$, then

$$\begin{aligned} \sum_{k=0}^{N-1} e_k(x) &= \sum_{k=0}^{N-1} e^{2\pi i k x} = \sum_{k=0}^{N-1} (e^{2\pi i x})^k = \frac{e^{2\pi i N x} - 1}{e^{2\pi i x} - 1} \\ &= \frac{e^{\pi i N x} (e^{\pi i N x} - e^{-\pi i N x})}{e^{\pi i x} (e^{\pi i x} - e^{-\pi i x})} = e^{\pi i (N-1)x} \frac{\sin(\pi N x)}{\sin(\pi x)} \end{aligned}$$

Thus, we have

$$F_N(x) = \frac{1}{N} \left| \sum_{k=0}^{N-1} e_k(x) \right|^2 = \frac{1}{N} \frac{\sin^2(\pi N x)}{\sin^2(\pi x)} \text{ if } x \notin \mathbb{Z}.$$

Hence, we know

$$F_N(x) = \begin{cases} N, & \text{if } x \in \mathbb{Z}; \\ \frac{1}{N} \frac{\sin^2(\pi N x)}{\sin^2(\pi x)}, & \text{if } x \notin \mathbb{Z}. \end{cases}$$

Fix $0 < \delta < \frac{1}{2}$ and $\delta \leq |x| \leq \frac{1}{2}$, then

$$\pi \delta \leq \pi |x| \leq \frac{\pi}{2},$$

then we know

$$|\sin(\pi x)| \geq \sin(\pi \delta).$$

Hence,

$$\left| \frac{1}{\sin(\pi x)} \right|^2 \leq \frac{1}{\sin^2(\pi \delta)},$$

and since $|\sin^2(\pi N x)| \leq 1$, so

$$F_N(x) = \frac{1}{N} \left| \frac{\sin(\pi N x)}{\sin(\pi x)} \right|^2 \leq \frac{1}{N} \frac{1}{\sin^2(\pi \delta)} \text{ where } \delta \leq |x| \leq \frac{1}{2} \leq 1 - \delta.$$

Hence, we can pick N large enough so that

$$\frac{1}{N} \frac{1}{\sin^2(\pi \delta)} < \varepsilon,$$

and we're done. ■

Now we can prove the main theorem.

Theorem 6.3.5 (Weierstrass Approximation Theorem by trigonometric polynomial). Let $f \in C(\mathbb{R}/\mathbb{Z}, \mathbb{C})$ be continuous 1-periodic function, and let $\varepsilon > 0$. Then there exists a trigonometric polynomial $P \in C(\mathbb{R}/\mathbb{Z}, \mathbb{C})$ s.t.

$$\|f - P\|_\infty \leq \varepsilon \text{ where } \|f - P\|_\infty = \sup_{x \in [0,1]} |f(x) - P(x)|.$$

This implies the set of trigonometric polynomial is dense in $C(\mathbb{R}/\mathbb{Z}, \mathbb{C})$ w.r.t. $\|\cdot\|_\infty$.

Proof. Let $f \in C(\mathbb{R}/\mathbb{Z}, \mathbb{C})$. We know that $\exists M > 0$ s.t. $|f(x)| \leq M$. Also, f is uniformly continuous, so there exists $\delta > 0$ s.t.

$$|x - y| < \delta \Rightarrow |f(x) - f(y)| < \frac{\varepsilon}{4}.$$

Let P be a trigonometric polynomial which is a $(\frac{\varepsilon}{4M}, \delta)$ approximation to the identity. By definition we know $P(x) \geq 0$ for $x \in \mathbb{R}$ and $\int_0^1 P(x) dx = 1$ and

$$P(x) < \frac{\varepsilon}{4M} \text{ when } \delta \leq |x| \leq 1 - \delta.$$

Then, $f * p$ is a trigonometric polynomial. This is because

$$P = \sum_{k=-N}^N c_k e_k,$$

and

$$\begin{aligned} f * P &= f * \left(\sum_{k=-N}^N c_k e_k \right) = \sum_{k=-N}^N c_k (f * e_k) \\ &= \sum_{k=-N}^N c_k \hat{f}(k) e_k \end{aligned}$$

which is definitely a trigonometric polynomial. Also,

$$\begin{aligned} |f(x) - (f * P)(x)| &= \left| f(x) - \int_0^1 f(x-y) P(y) dy \right| \\ &= \left| \int_0^1 (f(x) - f(x-y)) P(y) dy \right| \\ &\leq \int_0^1 |f(x) - f(x-y)| P(y) dy \end{aligned}$$

since $P(y) \geq 0$ for all $x \in \mathbb{R}$. Also, we have

$$\begin{aligned} \int_0^\delta |f(x) - f(x-y)| P(y) dy &\leq \frac{\varepsilon}{4} \int_0^\delta P(y) dy \leq \frac{\varepsilon}{4} \\ \int_{1-\delta}^1 |f(x) - f(x-y)| P(y) dy &\leq \int_{1-\delta}^1 P(y) dy \leq \frac{\varepsilon}{4}. \end{aligned}$$

On $[\delta, 1-\delta]$, we use $|f(x) - f(x-y)| \leq 2M$ and $P(y) < \frac{\varepsilon}{4}$, so

$$\int_\delta^{1-\delta} |f(x) - f(x-y)| P(y) dy \leq 2M \frac{\varepsilon}{4M} = \frac{\varepsilon}{2}.$$

Hence,

$$|f(x) - (f * P)(x)| < \varepsilon,$$

and we can pick $G = f * P$, which is a trigonometric polynomial, so that

$$|f(x) - G(x)| < \varepsilon$$

for all $x \in [0, 1]$, and thus we know

$$\sup_{x \in [0, 1]} |f(x) - G(x)| \leq \varepsilon.$$

Appendix A

Some Extra proof

A.1 Uncategorized

Theorem A.1.1. For a Cauchy sequence $\{x^{(n)}\}_{n=1}^{\infty}$, if there exists a subsequence $\{x^{(n_j)}\}_{j=1}^{\infty}$ converges to x , then $\{x^{(n)}\}_{n=1}^{\infty}$ also converges to x .

Proof. For all $\varepsilon > 0$, we know there exists $N > 0$ s.t. $j \geq N$ implies

$$d(x^{(n_j)}, x) < \frac{\varepsilon}{2}.$$

Also, there exists $N' > 0$ s.t. $i, j \geq N'$ implies

$$d(x^{(i)}, x^{(j)}) < \frac{\varepsilon}{2}.$$

Hence, if we pick some $d \geq N$ and $n_d \geq N'$, then we know for all $n \geq N'$, we have

$$d(x^{(n)}, x) \leq d(x^{(n)}, x^{(n_d)}) + d(x^{(n_d)}, x) < \frac{\varepsilon}{2} + \frac{\varepsilon}{2} = \varepsilon,$$

which means $\{x^{(n)}\}_{n=1}^{\infty}$ converges to x . ■

Definition A.1.1. A sequence of intervals I_n ($n \in \mathbb{N}$) is nested if $I_n \neq \emptyset$ and $I_{n+1} \subseteq I_n$ for all $n \in \mathbb{N}$. ($I_1 \supseteq I_2 \supseteq \dots$).

Now we want to know $\bigcap_{n \in \mathbb{N}} I_n \neq \emptyset$?

Here is some counterexamples. Consider $I_n = (0, \frac{1}{n})$, $n \in \mathbb{N}$. We can show that $\bigcap_{n=1}^{\infty} I_n = \emptyset$ by Archimedean Property. Besides, if $I_n = [n, \infty)$, $n \in \mathbb{N}$, this is trivial that $\bigcap_{n=1}^{\infty} I_n = \emptyset$.

Theorem A.1.2 (Theorem of nested intervals). If I_n ($n \in \mathbb{N}$) is a sequence of bounded closed nested intervals, then $\bigcap_{n=1}^{\infty} I_n \neq \emptyset$.

Proof. Write $I_n = [a_n, b_n]$ for all $n \in \mathbb{N}$. First, we know I_n is nested iff $a_n \leq b_n$ and a_n is nondecreasing and b_n is nonincreasing. Hence, $\forall n, m \in \mathbb{N}$, we have $a_n \leq a_{\max\{n, m\}} \leq b_{\max\{n, m\}} \leq b_m$. In other words, for every $m \in \mathbb{N}$, b_m is an upper bound of $\{a_n\}$. Hence, we know $c = \lim_{n \rightarrow \infty} a_n = \sup \{a_n\}$ exists. Then, $c \leq b_m$ for all $m \in \mathbb{N}$. Also, $c \geq a_n$ for all $n \in \mathbb{N}$. Hence, $a_n \leq c \leq b_n$ for all $n \in \mathbb{N}$, and thus we know $c \in I_n$ for all $n \in \mathbb{N}$. Thus, $c \in \bigcap_{n=1}^{\infty} I_n$. ■

Theorem A.1.3 (Bolzano Weierstrass Theorem). Suppose we have a bounded infinite sequence $a_n \in \mathbb{R}^m$, then \exists a subsequence $a_{n(m)}$ such that $a_{n(m)}$ is convergent.

Proof. We just talk about the case $m = 2$, and the higher case is similar. Choose $M > 0$ such that $a_n \in [-M, M] \times [-M, M]$ for all $n \in \mathbb{N}$. Suppose $[-M, M] \times [-M, M]$ is called Q . Divide Q into 4

squares with equal size, and choose one, say Q_1 such that $|\{n \mid a_n \in Q_1\}| = \infty$. Select $n_1 \in \mathbb{N}$ such that $a_{n_1} \in Q_1$. Repeat this step, that is, divide Q_1 into 4 subparts, then says the one subpart with infinite many a_n in it is Q_2 (Q_2 must exists). Select $n_2 \in \mathbb{N}$ such that $a_{n_2} \in Q_2$ and $n_2 > n_1$. Keep repeating this step, then by [Theorem A.1.2](#) we know

$$\bigcap_{n=1}^{\infty} Q_n \neq \emptyset.$$

Note A.1.1. Just think of the nested intervals are in x and y directions.

Actually, $\bigcap_{n=1}^{\infty} Q_n = \{a\}$ for some $a \in \mathbb{R}^2$, otherwise if there are two points in the intersection, then at some moment we will divide them into different subpart, which is a contradiction. It can be seen that $\lim_{k \rightarrow \infty} a_{n(k)} = a$. ■

Theorem A.1.4. If (X, d) is a metric space and $\{a_n\}_{n=1}^{\infty}, \{b_n\}_{n=1}^{\infty} \subseteq X$. Now if $\lim_{n \rightarrow \infty} d(a_n, b_n) = 0$ and $\lim_{n \rightarrow \infty} a_n = p$ for some $p \in X$, then $\lim_{n \rightarrow \infty} b_n = p$.

Proof. Since we know for all $\varepsilon > 0$, $\exists N > 0$ s.t. $n \geq N$ implies $d(a_n, p) < \varepsilon$, and there exists $N_1, N_2 > 0$ s.t. $n \geq N_1$ implies $d(b_n, a_n) < \frac{\varepsilon}{2}$ and $n \geq N_2$ implies $d(a_n, p) < \frac{\varepsilon}{2}$, so now for $n \geq \max\{N_1, N_2\}$, we know

$$d(b_n, p) = d(b_n, a_n) + d(a_n, p) < \frac{\varepsilon}{2} + \frac{\varepsilon}{2} = \varepsilon.$$

■

Theorem A.1.5. If $S \subseteq \mathbb{R}$, and $\sup S$ exists for some set S , then there exists a sequence of S converging to $\sup S$.

Proof. By the definition of \sup , we know for all $\varepsilon > 0$, $\exists s \in S$ s.t. $\sup S \geq s > \sup S - \varepsilon$, so pick $\varepsilon = \frac{1}{n}$ for all $n \in \mathbb{N}$, we can form $(s^{(n)})_{n=1}^{\infty}$ converging to $\sup S$. ■

A.2 The uniqueness of the convergence of function

Theorem A.2.1. If $(f^{(n)})_{n=1}^{\infty}$ converges pointwise to f and converges pointwise to g , then $f = g$.

Proof. Write down the definition and use triangle inequality. ■

Theorem A.2.2. If $(f^{(n)})_{n=1}^{\infty}$ converges uniformly to f and converges uniformly to g , then $f = g$.

Proof. Since uniform convergence implies pointwise convergence, so $(f^{(n)})_{n=1}^{\infty}$ converges uniformly to f and g , so $f = g$ by [Theorem A.2.1](#). ■

Theorem A.2.3. If $(f^{(n)})_{n=1}^{\infty}$ converges uniformly to f and converges pointwise to g , then $f = g$.

Proof. Since uniform convergence implies pointwise convergence, so $(f^{(n)})_{n=1}^{\infty}$ converges pointwise to f , and by [Theorem A.2.1](#), we know $f = g$. ■

A.3 Continuity of power series

Theorem A.3.1. If $f(x)$ is real analytic at a , then suppose

$$f(x) = \sum_{n=0}^{\infty} c_n(x-a)^n, \quad \text{converges for all } x \in (a-r, a+r)$$

where $r > 0$, then f is continuous on $(a-r, a+r)$.

Differentiable perspective. Since f is differentiable on $(a-r, a+r)$ by [Theorem 5.2.2](#), and differentiability implies continuity, so we know f is continuous on $(a-r, a+r)$. ■

Uniform convergence perspective. We first give a lemma:

Lemma A.3.1. Suppose $f^{(n)} : X \rightarrow \mathbb{R}$ and $f : X \rightarrow \mathbb{R}$ for some metric space X , then if $(f^{(n)})_{n=1}^{\infty} \rightarrow f$ uniformly and $f^{(n)}$ is continuous for all $n \in \mathbb{N}$, then f is continuous.

Proof. Note that for $x, x_0 \in X$, we have

$$|f(x) - f(x_0)| \leq |f(x) - f^{(N)}(x)| + |f^{(N)}(x) - f^{(N)}(x_0)| + |f^{(N)}(x_0) - f(x_0)|,$$

and R.H.S. can be arbitrarily small if we pick x, x_0 close enough due to the uniform convergence and continuity. ■

By this lemma, we can deduce the continuity of f since

$$f(x) = \sum_{n=0}^{\infty} c_n(x-a)^n$$

is uniformly convergent on $(a-r, a+r)$ and the partial sum S_n is continuous. ■

A.4 Some test for convergence of series

Theorem A.4.1 (Necessary Condition for Convergence). If the series $\sum a_n$ converges, then $\lim_{n \rightarrow \infty} a_n = 0$.

Theorem A.4.2 (Direct Comparison Test). Suppose $0 \leq a_n \leq b_n$ for all sufficiently large n .

- If $\sum b_n$ converges, then $\sum a_n$ converges.
- If $\sum a_n$ diverges, then $\sum b_n$ diverges.

Theorem A.4.3 (Limit Comparison Test). Let $a_n, b_n > 0$ for all n . If

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = c, \quad 0 < c < \infty,$$

then either both $\sum a_n$ and $\sum b_n$ converge or both diverge.

Theorem A.4.4 (Ratio Test (d'Alembert)). Let $a_n \neq 0$ and define

$$L = \lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right|.$$

Then:

- If $L < 1$, the series $\sum a_n$ converges absolutely.
- If $L > 1$, the series diverges.
- If $L = 1$, the test is inconclusive.

Theorem A.4.5 (Root Test (Cauchy)). Let

$$L = \lim_{n \rightarrow \infty} \sqrt[n]{|a_n|}.$$

Then:

- If $L < 1$, the series $\sum a_n$ converges absolutely.
- If $L > 1$, the series diverges.
- If $L = 1$, the test is inconclusive.

Theorem A.4.6 (Integral Test). Let $f(x)$ be continuous, positive, and decreasing on $[1, \infty)$, and let $a_n = f(n)$. Then

$$\sum_{n=1}^{\infty} a_n \text{ converges} \Leftrightarrow \int_1^{\infty} f(x) dx \text{ converges}.$$

Theorem A.4.7 (Alternating Series Test (Leibniz)). If (a_n) is a decreasing sequence of positive numbers with $\lim_{n \rightarrow \infty} a_n = 0$, then

$$\sum_{n=1}^{\infty} (-1)^n a_n$$

converges.

Theorem A.4.8 (p -Series Test). The series

$$\sum_{n=1}^{\infty} \frac{1}{n^p}$$

converges if and only if $p > 1$.

Theorem A.4.9 (Geometric Series Test). The series

$$\sum_{n=0}^{\infty} ar^n$$

converges if and only if $|r| < 1$, in which case the sum equals $\frac{a}{1-r}$.

Theorem A.4.10 (Raabe's Test). Let $a_n > 0$ and define

$$R = \lim_{n \rightarrow \infty} n \left(\frac{a_n}{a_{n+1}} - 1 \right).$$

Then:

- If $R > 1$, the series $\sum a_n$ converges.
- If $R < 1$, the series diverges.

- If $R = 1$, the test is inconclusive.

A.5 Composition of real analytic functions is analytic

Theorem A.5.1. Suppose $f, g : \mathbb{R} \rightarrow \mathbb{R}$ are both real analytic, then $g(f(x))$ is also real analytic.

Proof. Let c be any point in the domain of $g \circ f$; so c is in the domain of f and $f(c)$ is in the domain of g . Expand f and g as power series, converging absolutely on closed disks/intervals:

$$f(x) = \sum_{m \geq 0} a_m (x - c)^m, \quad |x - c| \leq R, \quad \sum_{m \geq 0} |a_m| R^m < \infty,$$

$$g(y) = \sum_{n \geq 0} b_n (y - f(c))^n, \quad |y - f(c)| \leq S, \quad \sum_{n \geq 0} |b_n| S^n < \infty.$$

Since f is continuous (meaning $f(x) \rightarrow f(c) = a_0$ when $x \rightarrow c$), there is some $r \leq R$ such that $|f(x) - f(c)| \leq S$ whenever $|x - c| \leq r$. Thus both power series are absolutely convergent for $|x - c| \leq r$, and in particular:

$$g(f(x)) = \sum_{n \geq 0} b_n \left(\sum_{m \geq 1} a_m (x - c)^m \right)^n.$$

However, to validly rearrange terms we need a stronger bound. Notice:

$$\sum_{m \geq 1} |a_m| |x - c|^m \leq |x - c| \sum_{m \geq 1} |a_m| R^{m-1} = M |x - c|,$$

where

$$M = \frac{1}{R} \sum_{m \geq 1} |a_m| R^m \leq \frac{1}{R} \sum_{m \geq 0} |a_m| R^m < \infty.$$

Take $r = \min\{S/M, R\}$. Then for $|x - c| \leq r$:

$$\sum_{m \geq 1} |a_m| |x - c|^m \leq M |x - c| \leq Mr \leq S.$$

So:

$$\sum_{n \geq 0} |b_n| \left(\sum_{m \geq 1} |a_m| |x - c|^m \right)^n \leq \sum_{n \geq 0} |b_n| S^n < \infty.$$

Hence the nested sums converge absolutely, and we may rearrange terms freely. We can expand

$$\begin{aligned} g(f(x)) &= \sum_{n \geq 0} b_n (x - c)^n \left(\sum_{m \geq 1} a_m (x - c)^m \right)^n \\ &= b_0 + b_1 (x - c) (a_1 + a_2 (x - c) + a_3 (x - c)^2 + \dots) \\ &\quad + b_2 (x - c)^2 (a_1 + a_2 (x - c) + \dots)^2 + b_3 (x - c)^3 (a_1 + a_2 (x - c) + \dots)^3 + \dots \end{aligned}$$

Collecting like powers of $(x - c)$, one obtains

$$g(f(x)) = \sum_{p \geq 0} (x - c)^p \sum_{\substack{n \geq 0 \\ n \leq p}} b_n \sum_{\substack{k_1, k_2, k_3, \dots \geq 0 \\ k_1 + 2k_2 + 3k_3 + \dots = p \\ k_1 + k_2 + k_3 + \dots = n}} \frac{n!}{k_1! k_2! k_3! \dots} a_1^{k_1} a_2^{k_2} a_3^{k_3} \dots$$

This shows $g(f(x))$ has a convergent power series in $(x - c)$, so it is analytic at c . ■

Appendix B

TA Class

B.1 Week 12

Problem B.1.1 (HW7 Q4). Suppose $f_n(x) = \frac{x}{1+nx^2}$, where $x \in \mathbb{R}$ for $n = 1, 2, \dots$. Define $f(x) = \lim_{n \rightarrow \infty} f_n(x)$ and $g(x) = \lim_{n \rightarrow \infty} f'_n(x)$.

- (a) Prove $f'(x)$ exists for all $x \in \mathbb{R}$, but that $f'(0) \neq g(0)$. For what values of x is $f'(x) = g(x)$?
- (b) In what intervals of \mathbb{R} does $f_n \rightarrow f$ uniformly?
- (c) In what intervals of \mathbb{R} does $f'_n \rightarrow g$ uniformly?

proof of (a). For $x = 0$, $f_n(0) = 0$ for all $n \in \mathbb{N}$, so $f(0) = \lim_{n \rightarrow \infty} f_n(0) = 0$. For $x \neq 0$, we know

$$f_n(x) = \frac{x}{1+nx^2} = \frac{1}{n} \frac{1}{x(1+\frac{1}{nx^2})} \leq \frac{1}{n} \frac{1}{x} \rightarrow 0 \text{ as } n \rightarrow \infty.$$

Hence, $f(x) = \lim_{n \rightarrow \infty} f_n(x) = 0$. Thus, $f(x) = 0$ on \mathbb{R} . Now compute

$$f'_n(x) = \frac{1 - nx^2}{(1 + nx^2)^2},$$

for $x = 0$, we know $f'_n(0) = \frac{1-0}{(1+0)^2} = 1$ for all $n \in \mathbb{N}$ and thus $g(0) = 1$. For $x \neq 0$,

$$|f'_n(x)| = \left| \frac{1}{n} \frac{-1 + \frac{1}{nx^2}}{x^2(1 + \frac{1}{nx^2})} \right| \leq \frac{1}{n} \frac{1}{x^2} \rightarrow 0 \text{ as } n \rightarrow \infty,$$

so $g(x) = 0$. Hence,

$$g(x) = \begin{cases} 1, & \text{if } x = 0; \\ 0, & \text{if } x \neq 0. \end{cases}$$

■

proof of (b). It suffices to show

$$\sup_{x \in \mathbb{R}} |f_n(x) - f(x)| \rightarrow 0 \text{ as } n \rightarrow \infty.$$

Define $\varphi_n(x) = |f_n(x)| = \left| \frac{x}{1+nx^2} \right|$, then $\varphi_n(x)$ is even, so we only need to study $x \geq 0$. Consider $x > 0$, then

$$\varphi_n(x) = \frac{x}{1+nx^2} \Rightarrow \varphi'_n(x) = \frac{(1+nx^2) - x(2nx)}{(1+nx^2)^2} = \frac{1-nx^2}{(1+nx^2)^2},$$

so $\varphi'_n(x) = 0$ iff $1 - nx^2 = 0$, which means $x = \frac{1}{\sqrt{n}}$ is the critical point, and since $\varphi_n(x)$ is decreasing

for $x > \frac{1}{\sqrt{n}}$, so $\varphi_n\left(\frac{1}{\sqrt{n}}\right)$ attains the maximum on $(0, \infty)$. Hence,

$$\sup_{x \in \mathbb{R}} |f_n(x) - f(x)| = \varphi_n\left(\frac{1}{\sqrt{n}}\right) = \frac{1}{2\sqrt{n}} \rightarrow 0 \text{ as } n \rightarrow \infty.$$

Hence, we can conclude that $f_n \rightarrow f$ uniformly. ■

proof of (c).

- Case 1: If $0 \notin \bar{I}$, then $\exists a > 0$ s.t. $\forall x \in I, |x| \geq a$. Hence, $g(x) = 0$ for all $x \in I$, so $g(x) = 0$ for all $x \in I$. Now

$$|f'_n(x)| = \left| \frac{1 - nx^2}{(1 + nx^2)^2} \right| \leq \frac{1 + nx^2}{(1 + nx^2)^2} = \frac{1}{1 + nx^2} \leq \frac{1}{1 + an^2} \rightarrow 0 \text{ as } n \rightarrow \infty \quad \forall x \in I.$$

Hence, $f'_n \rightarrow g$ uniformly on I .

- Case 2: $0 \in \bar{I}$, then there exists $b > 0$ s.t. $[-b, 0] \subseteq I$ or $(0, b] \subseteq I$. Note that

$$f'_n(x) = \frac{1 - nx^2}{(1 + nx^2)^2}.$$

Consider $x_n = \frac{1}{2\sqrt{n}}$ if $(0, b] \subseteq I$ (or $x_n = -\frac{1}{2\sqrt{n}}$ if $[-b, 0] \subseteq I$). When n is large, we see that $|x_n| < b$. Then, $\exists N \in \mathbb{N}$ s.t. $\forall n \geq N$, we have $x_n \in I$, and

$$f'_n(x_n) = \frac{1 - n\left(\frac{1}{2\sqrt{n}}\right)^2}{\left(1 + n\left(\frac{1}{2\sqrt{n}}\right)^2\right)^2} = \frac{\frac{3}{4}}{\frac{25}{16}} = \frac{12}{25} \quad \forall n \geq N.$$

Hence,

$$\sup_{x \in I} |f'_n(x) - g(x)| \geq |f'_n(x_n) - 0| = \frac{12}{25} \quad \forall n \geq N,$$

so it is not uniformly convergent. ■

Problem B.1.2 (HW7 Q6). Suppose $f_n(x) = \frac{1}{n}e^{-n^2x^2}$ for $x \in \mathbb{R}$ and $n = 1, 2, \dots$. Prove that $f_n \rightarrow 0$ uniformly in \mathbb{R} . Show that $f'_n \rightarrow 0$ pointwise in \mathbb{R} but not uniformly on any interval containing 0.

Proof. Note that

$$|f_n(x)| \leq \frac{1}{n} \text{ since } e^{-n^2x^2} \leq 1 \quad \forall x \in \mathbb{R}.$$

Hence,

$$\sup_{x \in \mathbb{R}} |f_n(x)| = \frac{1}{n} \rightarrow 0 \text{ as } n \rightarrow \infty,$$

so $f_n \rightarrow 0$ uniformly in \mathbb{R} . Now note that

$$f'_n(x) = 2nxe^{-n^2x^2}.$$

For $x = 0$, we have $f'_n(0) = 0$ for all $n \in \mathbb{N}$, so $\lim_{n \rightarrow \infty} f'_n(0) = 0$. For $x \neq 0$, we know

$$f'_n(x) = -2nxe^{-n^2x^2}.$$

Let $y = nx$, then $y \rightarrow \infty$ as $n \rightarrow \infty$. Hence, $f'_n(x) = -2ye^{-y^2}$, and

$$\lim_{n \rightarrow \infty} f'_n(x) = \lim_{y \rightarrow \infty} -2ye^{-y^2} = 0.$$

Hence, $f'_n \rightarrow 0$ pointwise. Now we know

$$\sup_{x \in \mathbb{R}} |f'_n(x) - 0| = \sup_{x \in \mathbb{R}} |f'_n(x)|.$$

Define $\varphi_n(x) = |f'_n(x)| = 2n|x|e^{-n^2x^2}$. Then, $\varphi_n(x)$ is even, and thus we only need to study $x > 0$. For $x > 0$, $\varphi_n(x) = 2nxe^{-n^2x^2}$, and

$$\varphi'_n(x) = 2ne^{-n^2x^2} + 2n(-2n^2x)e^{-n^2x^2} = 2ne^{-n^2x^2}(1 - 2n^2x^2).$$

Hence, $\varphi'_n(x) = 0$ iff $1 - 2n^2x^2 = 0$, so $x = \frac{1}{\sqrt{2n}}$. Note that $\varphi_n(x)$ decreases for $x > \frac{1}{\sqrt{2n}}$, so $\varphi_n\left(\frac{1}{\sqrt{2n}}\right)$ attains the maximum. Consider $x_n = \frac{1}{\sqrt{2n}}$ if $(0, b] \subseteq I$ (or $x_n = -\frac{1}{\sqrt{2n}}$ if $[-b, 0) \subseteq I$). Thus, there exists $N > 0$ s.t. $\forall n \geq N$, $x_n \in I$. Hence,

$$\varphi_n(x_n) = \varphi\left(\frac{1}{\sqrt{2n}}\right) = \sqrt{2}e^{-\frac{1}{2}} \Rightarrow \sup_{x \in I} |f'_n(x)| = \sqrt{2}e^{-\frac{1}{2}} \quad \forall n \geq N,$$

and thus not uniformly convergent. ■

Appendix C

Supplement

C.1 L^2 norm metric on $C(\mathbb{R}/\mathbb{Z}, \mathbb{C})$ is not complete

Remark 5.2.11. Define, for each $n \in \mathbb{N}$, a function $f_n : [0, 1] \rightarrow \mathbb{R}$ by restricting it to $[0, 1]$ and then extending periodically. On $[0, 1]$ set

$$f_n(x) := \begin{cases} 0, & 0 \leq x \leq \frac{1}{2} - \frac{1}{n}, \\ \frac{n}{2} \left(x - \left(\frac{1}{2} - \frac{1}{n} \right) \right), & \frac{1}{2} - \frac{1}{n} < x < \frac{1}{2} + \frac{1}{n}, \\ 1, & \frac{1}{2} + \frac{1}{n} \leq x \leq 1. \end{cases}$$

Each f_n is continuous on $[0, 1]$. As $n \rightarrow \infty$,

$$f_n \longrightarrow f \quad \text{in } L^2([0, 1]),$$

where

$$f(x) := \begin{cases} 0, & 0 \leq x < \frac{1}{2}, \\ \frac{1}{2}, & x = \frac{1}{2}, \\ 1, & \frac{1}{2} < x \leq 1. \end{cases}$$

(Any choice of value at $x = \frac{1}{2}$ gives the same L^2 class.) The limit f has a jump discontinuity at $x = \frac{1}{2}$, hence $f \notin C([0, 1], \mathbb{R})$. Therefore $C([0, 1], \mathbb{R})$ is not complete with respect to the L^2 -metric.

To verify the L^2 convergence, note that

$$(f_n - f)(x) = \begin{cases} 0, & 0 \leq x \leq \frac{1}{2} - \frac{1}{n}, \\ \frac{n}{2} \left(x - \left(\frac{1}{2} - \frac{1}{n} \right) \right), & \frac{1}{2} - \frac{1}{n} < x < \frac{1}{2}, \\ 0, & x = \frac{1}{2}, \\ \frac{n}{2} \left(x - \left(\frac{1}{2} - \frac{1}{n} \right) \right) - 1, & \frac{1}{2} < x < \frac{1}{2} + \frac{1}{n}, \\ 0, & \frac{1}{2} + \frac{1}{n} \leq x \leq 1. \end{cases}$$

In particular, $|f_n(x) - f(x)| \leq \frac{1}{2}$ for all $x \in [0, 1]$. Thus

$$\int_0^1 |f_n(x) - f(x)|^2 dx \leq \int_{\frac{1}{2} - \frac{1}{n}}^{\frac{1}{2}} \frac{1}{4} dx + \int_{\frac{1}{2}}^{\frac{1}{2} + \frac{1}{n}} \frac{1}{4} dx = \frac{1}{2n}.$$

Hence

$$\|f_n - f\|_{L^2} \longrightarrow 0 \quad \text{as } n \rightarrow \infty.$$

We now modify the previous example by producing an *even*, 2-periodic version of the functions. Define g_n on $[-1, 1]$ by taking the even extension of f_n .

Definition 0.1. For each $n \in \mathbb{N}$, define

$$g_n : [-1, 1] \rightarrow \mathbb{R}$$

by

$$g_n(x) := \begin{cases} f_n(x), & 0 \leq x \leq 1, \\ f_n(-x), & -1 \leq x < 0, \end{cases}$$

and extend periodically with period 2, i.e.

$$g_n(x+2) = g_n(x) \quad \text{for all } x \in \mathbb{R}.$$

Here $f_n : [0, 1] \rightarrow \mathbb{R}$ is the piecewise linear function

$$f_n(x) := \begin{cases} 0, & 0 \leq x \leq \frac{1}{2} - \frac{1}{n}, \\ \frac{n}{2} \left(x - \left(\frac{1}{2} - \frac{1}{n} \right) \right), & \frac{1}{2} - \frac{1}{n} < x < \frac{1}{2} + \frac{1}{n}, \\ 1, & \frac{1}{2} + \frac{1}{n} \leq x \leq 1. \end{cases}$$

Since $g_n(x) = f_n(|x|)$ for all $x \in [-1, 1]$, the pointwise limit $g := \lim_{n \rightarrow \infty} g_n$ is the even extension of the limit f , namely,

$$g(x) := \begin{cases} 0, & |x| < \frac{1}{2}, \\ \frac{1}{2}, & |x| = \frac{1}{2}, \\ 1, & \frac{1}{2} < |x| \leq 1, \end{cases}$$

and extended 2-periodically to all of \mathbb{R} .

To verify convergence in $L^2([-1, 1])$, note that $g_n(x) = f_n(|x|)$ and $g(x) = f(|x|)$. Hence

$$\|g_n - g\|_{L^2([-1, 1])}^2 = 2 \|f_n - f\|_{L^2([0, 1])}^2.$$

From the previous estimate,

$$\|f_n - f\|_{L^2([0, 1])}^2 \leq \frac{1}{2n},$$

we obtain

$$\|g_n - g\|_{L^2([-1, 1])}^2 \leq \frac{1}{n} \quad \implies \quad \|g_n - g\|_{L^2([-1, 1])} \rightarrow 0.$$

Thus (g_n) converges in $L^2([-1, 1])$ to the discontinuous, even, 2-periodic limit g .

Let $h_n(x) = g_n(2x)$ and $h(x) = g(2x)$. Then for every $x \in \mathbb{R}$,

$$h_n(x+1) = g_n(2(x+1)) = g_n(2x+2) = g_n(2x) = h_n(x),$$

because each g_n is continuous and 2-periodic. Hence h_n is a continuous, 1-periodic function.

Moreover,

$$\begin{aligned} \|h_n - h\|_{L^2([0,1])} &= \int_0^1 |g_n(2x) - g(2x)|^2 dx \\ &= \frac{1}{2} \int_0^2 |g_n(y) - g(y)|^2 dy \\ &= \frac{1}{2} \int_{-1}^1 |g_n(y) - g(y)|^2 dy \\ &= \frac{1}{2} \|g_n - g\|_{L^2([-1,1])} \longrightarrow 0. \end{aligned}$$

since $g_n \rightarrow g$ in $L^2([-1, 1])$. Thus (h_n) converges in $L^2([0, 1])$ to the discontinuous, 1-periodic limit function h .
