Chapter 1

Vector Space

Lecture 1

1.1 Introduction to vector and vector space

In high school, our vectors are in $\mathbb{R}^2$ and $\mathbb{R}^3$, and we have define the addition and scalar multiplication of vectors.

Figure 1.1: Vectors in $\mathbb{R}^2$

Example 1.1.1. $\mathbb{R}^n = \{(a_1, a_2, \ldots, a_n \mid a_i \in \mathbb{R})\}$

With this type of space, we can define addition and multiplication as

$$(a_1, a_2, \ldots, a_n) + (b_1, b_2, \ldots, b_n) = \{a_1 + b_1, a_2 + b_2, \ldots, a_n + b_n\}$$
$$\alpha \cdot (a_1, a_2, \ldots, a_n) = (\alpha a_1, \alpha a_2, \ldots, \alpha a_n)$$

Also, if we define a space:

Example 1.1.2. $V = \{\text{function } f : (a, b) \to \mathbb{R}\}$, where (a, b) is an open interval.

then this can also be a vector space after defining addtion and multiplication.

Note 1.1.1. In a vector space, we have to make sure the existence of 0-element, which means $0(x) = 0$.

Now we give a more abstract example:

Example 1.1.3. Suppose S is any set, then define $V = \{\text{all functions from } S \text{ to } \mathbb{R}\}$

If we define $(f + g)(s) = f(s) + g(s)$ and $(\alpha \cdot f)(s) = \alpha \cdot f(s)$, and $0(s) = 0$, then this is also a vector space.

Put some linear conditions

> **Example 1.1.4.** In $\mathbb{R}^n$, fix $\vec{a} = (a_1, a_2, \ldots, a_n) \in \mathbb{R}^n$, if we define
> $$W = \{(x_1, x_2, \ldots, x_n) \in \mathbb{R}^n \mid a_1 x_1 + a_2 x_2 + \cdots + a_n x_n = 0\},$$
> then this is also a vector space.

However, if we have
$$W' = \{(x_1, \ldots, x_n) \in \mathbb{R}^n \mid a_1 x_1 + \cdots + a_n x_n = 1\},$$
then this is not a vector space because it is not close.

> **Example 1.1.5.** In $V = \{(a,b) \to \mathbb{R}\}$ or $W_1 = \{\text{polynomial defined on } (a,b)\}$, these are both vector space.

> **Remark 1.1.1.** In the later course, we will learn that W_1 is a subspace of V.

> **Example 1.1.6.** If we furtherly defined $W_1^{(k)} = \{\text{polynomial degree } \leq k\}$, then this is also a vector space.

> **Remark 1.1.2.** $W_1^{(k)}$ is actually isomorphic to $\mathbb{R}^{k+1}$ since
> $$a_0 + a_1 x + a_2 x^2 + \cdots + a_k x^k \leftrightarrow (a_0, a_1, a_2, \ldots, a_n).$$

> **Example 1.1.7.** $W_2 = \{\text{continuous function on } (a,b)\}$ and $W_3 = \{\text{differentiable functions}\}$ are also both vector spaces.

> **Example 1.1.8.** $W_4 = \left\{\frac{\mathrm{d}^2 f}{\mathrm{d}x^2} = 0\right\}$ and $W_5 = \left\{\frac{\mathrm{d}^2 f}{\mathrm{d}x^2} = -f\right\}$ are both vector spaces.
>
> **Proof.**
> $$W_4 = \{a_0 + a_1 x\}$$
> $$W_5 = \{a_1 \cos x + a_2 \sin x\}$$
>
> $\circledast$

1.2 Formal definition of vector spaces

1.2.1 Vector Spaces Over $\mathbb{R}$

> **Definition 1.2.1.** Suppose V is a non-empty set equipped with
>
> - addition: $V \times V \to V$, that is, given $u, v \in V$, defining $u + v \in V$
>
> - scalare multiplication: $\mathbb{R} \times V \to V$, that is, given $\alpha \to \mathbb{R}$ and $v \in V$, we need to have $\alpha v \in V$
>
> Also, we need some good properties or conditions
>
> - For addition,
>   - $u + v = v + u$
>   - $(u + v) + w = u + (v + w)$
> - There exists $0 \in V$ such that $u + 0 = u = 0 + u$

- Given $v \in V$, there exists $-v \in V$ such that $v + (-v) = 0 = (-v) + v$

- For scalar multiplication,

    - $1 \cdot v = v$ for all $v \in V$
    - $(\alpha\beta)v = \alpha \cdot (\beta v)$ for all $\alpha, \beta \in \mathbb{R}$ and $v \in V$.

- For addition and multiplication,

    - $\alpha(u + v) = \alpha u + \alpha v$
    - $(\alpha + \beta)u = \alpha u + \beta u$

Lecture 2

1.3   Vector Space over general field

Now we introduce the concept of field.

Definition 1.3.1 (Field). A set F with $+$ and $\cdot$ is called a **field** if

- $\alpha + \beta = \beta + \alpha$ and $(\alpha + \beta) + \gamma = \alpha + (\beta + \gamma)$.

- There exists $0 \in F$ such that $\alpha + 0 = 0 + \alpha = \alpha$.

- For $\alpha \in F$, there exists $-\alpha$ such that $\alpha + (-\alpha) = 0$.

- $\alpha\beta = \beta\alpha$ and $(\alpha\beta)\gamma = \alpha(\beta\gamma)$

- $\exists 1$ such that $1 \neq 0$ and $1 \cdot \alpha = \alpha$.

- For $\alpha \neq 0$, $\exists \alpha^{-1} \in F$ such that $\alpha\alpha^{-1} = 1$.

- $\alpha(\beta + \gamma) = \alpha\beta + \alpha\gamma$

Example 1.3.1. $\mathbb{Q} \subseteq \mathbb{R} \subseteq \mathbb{C}$ are all fields but $\mathbb{Z}$ is not.

Example 1.3.2. $\{0, 1\}$ is also a field.

Now we know the concept of filed, so we can make a vector space over a field.

Theorem 1.3.1 (Cancellation law). Suppose $v_1, v_2, w \in V$, a vector space, then if $v_1 + w = v_2 + w$, then $v_1 = v_2$.

Proof.

$$v_1 = v_1 + (w + (-w)) = (v_1 + w) + (-w) = (v_2 + w) + (-w) = v_2 + (w + (-w)) = v_2.$$

∎

Theorem 1.3.2. The zero vector 0 is unique.

Proof. Suppose we have $0, 0'$ both zero vector, then for some $0 = 0 + 0' = 0'$. ∎

Theorem 1.3.3. For any $v \in V$, $0 \cdot u = 0$.

Proof. $0 \cdot u = (0 + 0) \cdot u = 0 \cdot u + 0 \cdot u$, so $0 = 0 \cdot u$ by cancellation law. ∎

Theorem 1.3.4. $(-1) \cdot u = -u$.

Theorem 1.3.5. Given any $u \in V$ is unique, $-u$ is unique.

1.4 Subspaces

Definition 1.4.1 (subspace)**.** Let V be a vector space. A non-empty subset $W \subseteq V$ is called a subspace of V if W is itself a vector space under $+$ and $\cdot$ on V.

Example 1.4.1. $M_n(F) = \{n \times n \text{ matrix with entries in } F\}$ is a vector space, and

$$U_n(F) = \left\{ \begin{pmatrix} a_{11} & & & \\ 0 & a_{22} & & \\ \vdots & & \ddots & \\ 0 & \cdots & 0 & a_{nn} \end{pmatrix} \right\}$$

is a subspace of $M_n(F)$.

Proposition 1.4.1. Suppose V is a vector space, and $W \subseteq V$ is non-empty, then

$$W \text{ is a subspace} \iff \text{For } u, v \in W, \alpha \in F, \text{ we have } u + v \in W \text{ and } \alpha \cdot u \in W.$$

proof of $\Rightarrow$. Clear. $\blacksquare$

proof of $\Leftarrow$. First, we would want to check $0 \in W$, and we can pick any $u \in W$, and pick $\alpha = -1$, so we know $-u \in W$, and thus $0 = u + (-u) \in W$. $\blacksquare$

Corollary 1.4.1. If we want to check W is a subspace, we just need to check for $u, v \in W$, $\alpha \in F$, $u + \alpha v \in W$ or not.

1.5 Linear Combination

Definition 1.5.1 (Linear combinaiton)**.** Given $v_1, v_2, \ldots, v_n \in V$, a linear combination of them is a vector of the form
$$\alpha_1 v_1 + \alpha_2 v_2 + \cdots + \alpha_n v_n.$$

Proposition 1.5.1. Given $v_1, v_2, \ldots, v_n \in V$,

1. $W = \{\text{all linear combinations of } v, \ldots, v_n\}$ is a subspace.

2. This subspace is the smallest subspace containing $v_1, \ldots, v_n$. That is, if $W' \subseteq V$ is a subspace containing $v_1, \ldots, v_n$, then $W \subseteq W'$.

Notation. $\text{span}\{v_1, v_2, \ldots, v_n\} = \{\text{all linear combinations of } v_1, v_2, \ldots, v_n\}$

1.6 Linearly independent

Definition. Now we talk about the linear dependence and linear independence.

Definition 1.6.1 (Linearly dependent). $v_1, v_2, \ldots, v_n$ are linearly dependent if

$$\alpha_1 v_1 + \alpha_2 v_2 + \cdots + \alpha_n v_n = 0$$

for some $\alpha_1, \alpha_2, \ldots, \alpha_n$ not all zeros.

Definition 1.6.2 (Linearly independent). $v_1, v_2, \ldots, v_n$ are called linearly independent if they are not linearly dependent.

Corollary 1.6.1. Say $\alpha_i \neq 0$, then $v_i \in \text{span}\{\hat{v_1}, \hat{v_2}, \ldots, \hat{v_k}\}$ suppose the corresponding α_i of $\hat{v_1}, \ldots, \hat{v_k}$ are not zeros.

Corollary 1.6.2. Linearly independent means if $\alpha_1 v_1 + \cdots + \alpha_n v_n = 0$, then $\alpha_1 = \alpha_2 = \cdots = \alpha_n = 0$.

Corollary 1.6.3. Linearly independent meeans if $\sum \alpha_i v_i = \sum \beta_i v_i$, then $\alpha_i = \beta_i$ for all i.

Example 1.6.1.

- $v \in V$ is linearly independent iff $v \neq 0$.
- $v, w \in V$ are linearly independent iff v is not a scaler of w and w is not a scalar of v.

Lemma 1.6.1. $v_1, \ldots, v_n$ are linearly independent iff $v_i \notin \text{span}\{v_1, \ldots, v_{i-1}, v_{i+1}, \ldots, v_n\}$.

1.7 Basis

Definition. We now talking about basis

Definition 1.7.1 (Basis). $B = \{v_1, v_2, \ldots, v_n\}$ is called a basis of V if B spans V and B is linearly independent.

Definition 1.7.2 (Dimension). In this case, n is called the dimension of V, and denoted by $\dim V$.

Notation. $\text{span}\{v_1, v_2, \ldots, v_n\} = \langle v_1, v_2, \ldots, v_n \rangle$

Notation. $\text{span}(S) = \langle S \rangle$

Theorem 1.7.1. For any $v \in V$, it has a unique expression $v = \sum_{i=1}^{n} \alpha_i v_i$.

Lecture 3

As previously seen. A basis of a vector space V is a set $\{v_1, v_2, \ldots, v_n\}$ that is linearly independent and simultaneously spans V. That is, suppose we have $\sum a_i v_i = 0$ for some scalars a_i, then $a_i = 0$ for all i. Also, we call the number n, the dimension of V.

10 Sep 10:20

Example 1.7.1. Suppose we have $V = F^n = \{(\alpha_1, \alpha_2, \ldots, \alpha_n) \mid \alpha_i \in F\}$, then we have a **standard basis**, which is

$$e_1 = (1, 0, \ldots, 0)$$
$$e_2 = (0, 1, \ldots, 0)$$
$$\vdots$$
$$e_n = (0, 0, \ldots, 1)$$

since $\{e_i\}_{i=1}^n$ is linearly independent and for every $\vec{a} = (a_1, \ldots, a_n)$, we know

$$\vec{a} = \sum_{i=1}^n a_i e_i.$$

Example 1.7.2. Suppose

$$V = M_{n \times n}(F) = \left\{ \begin{pmatrix} \alpha_{11} & \alpha_{12} & \cdots & \alpha_{1n} \\ \alpha_{21} & \ddots & & \alpha_{2n} \\ \vdots & & & \\ \alpha_{n1} & \cdots & & \alpha_{nn} \end{pmatrix} \right\},$$

then we know

$$\{e_{ij}\}_{1 \leq i,j \leq n} = \begin{pmatrix} 0 & 0 & & & \\ 0 & & & & \\ & & 1 & & \\ 0 & & & 0 & \\ 0 & & & & 0 \end{pmatrix},$$

where the 1 is in the i-th row and j-th column.

Theorem 1.7.2. Suppose V is a vector space, and $V = \langle v_1, v_2, \ldots, v_n \rangle$ and $\{w_1, w_2, \ldots, w_m\}$ is linearly independent, then $m \leq n$. Furtheremore, one can make

$$\langle w_1, w_2, \ldots, w_m, v_{m+1}, \ldots, v_n \rangle = V$$

after rearrangement of $v_1, \ldots, v_n$.

Proof. We can do induction on m. It is trivial that $m = 0$ is true. Suppose the statement holds for a fixed m with $m \leq n$. Let $w_1, w_2, \ldots, w_{m+1}$ be linearly independent. In particular, $w_1, w_2, \ldots, w_m$ is linearly independent.

Claim 1.7.1. $m + 1 \leq n$.

Proof. Otherwise, if $m + 1 > n$, then since $m \leq n$, so $m = n$. Hence, by induction hypothesis, we know $\langle w_1, w_2, \ldots, w_m \rangle = V$. However, by Lemma 1.7.1 and the note following it, we know

$$\{w_1, w_2, \ldots, w_m\} \cup \{w_{m+1}\}$$

can not be linearly indepndent since $w_{m+1} \in V = \langle w_1, \ldots, w_m \rangle$. ⊛

Now we know $m + 1 \leq n$. By induction hypothesis, we know

$$\langle w_1, w_2, \ldots, w_m, v_{m+1}, \ldots, v_n \rangle = V$$

Claim 1.7.2. One of $v_{m+1}, \ldots, v_n$ can be replaced by w_{m+1}.

Proof. Since

$$w_{m+1} = \sum_{i=1}^{m} \alpha_i w_i + \sum_{j=m+1}^{n} \beta_j v_j.$$

Trivially, one of $\beta_j \neq 0$, say $\beta_{m+1} \neq 0$. Check

$$\langle w_1, \ldots, w_m, w_{m+1}, v_{m+2}, \ldots, v_n \rangle = V.$$

⊛

∎

Corollary 1.7.1. If $\{v_1, v_2, \ldots, v_n\}$ and $\{w_1, w_2, \ldots, w_m\}$ are bases of V, then $n = m$.

Remark 1.7.1. Corollary 1.7.1 tells us $\dim V$ is well-defined, which means the size of the bases of a vector space is unique.

Corollary 1.7.2. Suppose $\dim V = n$, then if $\langle v_1, v_2, \ldots, v_m \rangle = V$, then $m \geq n$. If $\{w_1, w_2, \ldots, w_m\}$ is linearly independent, then $m \leq n$. Also, any $\{v_i\}_{i=1}^{m}$ with $m > n$ is linearly dependent.

Lemma 1.7.1. Suppose $v_1, v_2, \ldots, v_n$ is linearly independent. If $w \notin \langle v_1, v_2, \ldots, v_n \rangle$, then

$$\{v_1, v_2, \ldots, v_n, w\}$$

is linearly independent.

Proof. Suppose $\sum_{i=1}^{n} \alpha_i v_i + \alpha_{i+1} w = 0$, then if $\alpha_{i+1} = 0$, we know $\alpha_1 = \alpha_2 = \cdots = \alpha_n = 0$ since $\{v_i\}_{i=1}^{n}$ is linearly independent. If $\alpha_{i+1} \neq 0$, then $w = \frac{1}{\alpha_{i+1}} \sum_{i=1}^{n} \alpha_i v_i \in \langle v_1, v_2, \ldots, v_n \rangle$, which is a contradiction. ∎

Note 1.7.1. The reverse of Lemma 1.7.1 is still correct and is trivial. That is, if $w \notin \{v_1, \ldots, v_n\}$ and $\{v_1, v_2, \ldots, v_n, w\}$ is linearly independent, then $\{v_1, \ldots, v_n\}$ is linearly independent.

Corollary 1.7.3. If $W \subseteq V$ is a subspace of V, then $\dim W \leq \dim V$.

Proof. If $\dim V = n$, and $\{w_i\}_{i=1}^{m}$ is a basis of W, then this basis is linearly independent in V, which means $m \leq n$ by Theorem 1.7.2. ∎

Corollary 1.7.4. If $v_1, v_2, \ldots, v_m$ is linearly independent, then $\{v_1, v_2, \ldots, v_m\}$ forms a basis after adding some $v_{m+1}, \ldots, v_n$ to it.

Theorem 1.7.3 (Dual version). If $\langle v_1, v_2, \ldots, v_n \rangle = V$, then $\{v_1, v_2, \ldots, v_m\}$ forms a basis after rearrangement, where $m \leq n$.

Remark 1.7.2. Most of the time, we consider finite-dimensional vector spaces.

Remark 1.7.3 (Examples of ∞-dim vector space).

-
  $$V = \{\text{all polynomials over } F\} = F[x] = \{a_0 + a_1 x + \cdots + a_n x^n \text{ for some } n \text{ where } a_i \in F\}.$$

-

$$W = \{(a_0, a_1, \dots) \mid a_i \in \mathbb{R}\}.$$

Notice that

$$W' = \{\text{convergent sequence}\} \subseteq W.$$

and

$$W'' = l^2 = \left\{(a_i) \mid \sum_{i=0}^{\infty} a_i^2 \text{ finite}\right\} \subseteq W'$$

Remark 1.7.4. We define $\dim\{0\} = 0$, which is the only vector space with dimension 0, and we define $\langle \varnothing \rangle = \{0\}$, which means $\varnothing$ is the basis of $\{0\}$.

Note 1.7.2. We call a subspace $W \subsetneq V$ is proper.

1.8 More on subspaces

Theorem 1.8.1. If W_1 and W_2 are subspace of V, then $W_1 \cap W_2$ is a subspace.

Theorem 1.8.2. If W_1, W_2 are subspaces of V, then $W_1 + W_2$ is still a subspace of V.

Remark 1.8.1. If W_1, W_2 are subspaces of V, then $W_1 \cup W_2$ may not be a subspace. (See HW1).

Remark 1.8.2. In fact, $W_1 \cap W_2$ is the largest subspaces contained in W_1 and W_2.

Remark 1.8.3. In fact, $W_1 + W_2$ is the smallest subspace containing both W_1 and W_2.

Corollary 1.8.1. Suppose S is the index set, and for all $i \in S$, W_i is a subspace of V, then

$$\bigcap_{i \in S} W_i = \{v \in V \mid v \in W_i \ \forall i\}$$

is also a subspace of V.

Corollary 1.8.2. Suppose S is the index set, and for all $i \in S$, W_i is a subspace of V, then

$$\sum_{i \in S} W_i = \{w_{i_1} + w_{i_2} + \cdots + w_{i_n} \text{ for some } i_j \in S\}$$

is also a subspace of V.

Proposition 1.8.1 (Dimension theorem)**.** Suppose $W_1, W_2 \subseteq V$ are subspaces of V, then

$$\dim(W_1 + W_2) = \dim W_1 + \dim W_2 - \dim(W_1 \cap W_2).$$

Lecture 4

In calculus, $f : \mathbb{R} \to \mathbb{R}$ is called continuous if $f\left(\lim_{x \to a} x\right) = \lim_{x \to a} f(x)$.

12 Sep 10:20

Definition 1.8.1 (Linear transformation). Suppose V, W are vector spaces over F. A function

$$T : V \to W$$
$$v \mapsto T(v)$$

is called a linear transformation or a linear map if

$$T(u + v) = T(u) + T(v) \quad T(\alpha v) = \alpha T(v),$$

or equivalently,

$$T(\alpha u + v) = \alpha T(u) + T(v).$$

Corollary 1.8.3. Suppose T is a linear transformation, then

$$T\left(\sum_{i=1}^{n} \alpha_i u_i\right) = \sum_{i=1}^{n} \alpha_i T(u_i).$$

Example 1.8.1. Suppose $V = \{\text{functions from } (-1, 1) \text{ to } \mathbb{R}\}$, and define $T_a(f) = f(a)$, then T_a is a linear transformation.

Example 1.8.2. Consider the space of column vectors,

$$F^n = \left\{ \begin{pmatrix} \alpha_1 \\ \alpha_2 \\ \vdots \\ \alpha_n \end{pmatrix} \mid \alpha_i \in F \right\},$$

and define $A = (a_{ij}) \in M_{n \times n}(F)$ by

$$A = \begin{pmatrix} a_{11} & \cdots & a_{1n} \\ \vdots & & \\ a_{m1} & \cdots & a_{mn} \end{pmatrix},$$

then if we have $T_A : F^n \to F^m$ where

$$\begin{pmatrix} x_1 \\ \vdots \\ x_n \end{pmatrix} \mapsto A \cdot \begin{pmatrix} x_1 \\ \vdots \\ x_n \end{pmatrix},$$

then T_A is a linear map.

> **Note 1.8.1.**
> $$\begin{pmatrix} & \vdots & \\ \alpha_{i1} & \cdots & \alpha_{in} \\ & \vdots & \end{pmatrix} \begin{pmatrix} x_1 \\ \vdots \\ x_n \end{pmatrix} = \begin{pmatrix} \vdots \\ \sum_{j=1}^{n} a_{ij} x_j \\ \vdots \end{pmatrix}$$

Example 1.8.3. Consider row of vector space,

$$F^m = \{(\alpha_1, \ldots, \alpha_m) \mid \alpha_i \in F\},$$

and $A \in M_{m \times n}(F)$, then if $T_A : F^m \to F^n$ where

$$T_A : u = (u_1, \ldots, u_m) \mapsto (u_1, \ldots, u_m) \cdot A$$

is a linear map.

Obeserve that a linear map $T : V \to W$ is determined by $T(v_i)$, where $\{v_1, \ldots, v_n\}$ is a basis of V.

Proposition 1.8.2. Suppose $\{v_1, v_2, \ldots, v_n\}$ is a basis of V, then pick any $w_1, \ldots, w_n \in W$. Then there is a unique linear map $T : V \to W$ satisfying $T(v_i) = w_i$.

Proof. Since any $v \in V$ has a unique representation $v = \sum_{i=1}^{n} \alpha_i v_i$. Hence, for a linear map $T : V \to W$, and for any $v \in V$, we know

$$T(v) = T\left(\sum_{i=1}^{n} \alpha_i v_i\right) = \sum_{i=1}^{n} \alpha_i T(v_i) = \sum_{i=1}^{n} \alpha_i w_i.$$

Hence, if such map exists, then it must be unique. Now we have to show the existence of this map. Now if we define a map

$$T\left(\sum_{i=1}^{n} \alpha_i v_i\right) = \sum_{i=1}^{n} \alpha_i w_i,$$

then we can check this is a linear map. $\blacksquare$

Example 1.8.4. Suppose F^n is the span of column vectors, and $A \in M_{m \times n}(F)$, and define $T_A(v) = Av$, then we can check $T_A(e_i) = c_i$, where c_i is the i-th column of A. This is the linear map that sends e_i to $c_i \in F^m$. If we pick $c_1, c_2, \ldots, c_n \in F^m$, then there is a unique map sending e_i to c_i. In fact, this map is

$$T_A : v \mapsto Av$$

, where the i-th column of A is c_i.

Definition. Given $T : V \to W$, where T is linear.

Definition 1.8.2 (Kernel)**.** The kernel/nullspace of T is defined as

$$\ker(T) = \{v \in V \mid T(v) = 0\} \subseteq V.$$

Definition 1.8.3 (Image)**.** The image/range of T is defined as

$$\mathrm{Im}(T) = \{T(v) \mid v \in V\} \subseteq W.$$

Remark 1.8.4. Kernel and Image are subspaces.

Lecture 5

As previously seen. Given such a linear map $T : V \to W$, we define

17 Sep. 10:20

$$\ker T = T^{-1}(0) \quad \text{kernel/null space of } T$$
$$\mathrm{Im}\, T = T(V) \quad \text{image/range of } T,$$

and $\ker T$ is a subspaces of V, and $\mathrm{Im}\, T$ is a subspace of W.

Definition. Now we define the nullity and rank of a linear map.

Definition 1.8.4 (nullity)**.** The nullity of T is the number

$$\nu(T) = \dim \ker T.$$

Definition 1.8.5 (rank)**.** The rank of T is the number $\operatorname{rank} T = \dim \operatorname{Im} T$.

Example 1.8.5. Suppose $T : F^n \to F^m$, where F^n is the column space of dimension n, then $T = T_A$ for a matrix $A \in M_{m \times n}(F)$ and $T_A(v) = Av$.

Proof. Suppose $A = (c_1, c_2, \ldots, c_n)$, where c_i is the i-th column vector of A. Consider the standard basis $\{e_1, e_2, \ldots, e_n\}$ of F^n, where e_i is the column vector with i-th position 1 and the other entries are all 0's. Then, $T_A(e_i) = c_i \in F^m$. Explicitly,

$$T_A \begin{pmatrix} x_1 \\ \vdots \\ x_n \end{pmatrix} = \begin{pmatrix} c_1 & \cdots & c_n \end{pmatrix} \begin{pmatrix} x_1 \\ \vdots \\ x_n \end{pmatrix} = x_1 c_1 + \cdots + x_n c_n$$

since we know

$$\begin{pmatrix} x_1 \\ \vdots \\ x_n \end{pmatrix} = \sum_i x_i e_i.$$

and $T_A(e_i) = c_i$. In this case,

$$\ker T_A = \text{all linear relations among } c_1, \ldots, c_n \subseteq F^n$$
$$\operatorname{Im} T_A = \operatorname{span}\{c_1, \ldots, c_n\} \subseteq F^m.$$

If we want to solve $\ker T_A$, then we need to solve

$$0 = x_1 \begin{pmatrix} a_{11} \\ a_{21} \\ \vdots \\ a_{m1} \end{pmatrix} + x_2 \begin{pmatrix} a_{12} \\ a_{22} \\ \vdots \\ a_{m2} \end{pmatrix} + \cdots + x_n \begin{pmatrix} a_{1n} \\ a_{2n} \\ \vdots \\ a_{mn} \end{pmatrix}.$$

Hence, we have to solve

$$\begin{cases} a_{11}x_1 + \cdots + a_{1n}x_n = 0 \\ a_{21}x_1 + \cdots + a_{2n}x_n = 0 \\ \vdots \\ a_{m1}x_1 + \cdots + a_{mn}x_n = 0. \end{cases}$$

Given $A = (c_1, \ldots, c_n)_{m \times n}$, then the column rank is $\dim \langle c_1, \ldots, c_m \rangle$. If we rewrite $A = (r_1, \ldots, r_m)^t$, where r_i is the i-th row of A, then the row rank is $\dim \langle r_1, r_2, \ldots, r_m \rangle$. Since we can define $S_A : F^m \to F^n$, where

$$v = (x_1, \ldots, x_m) \mapsto vA.$$

Remark 1.8.5. In fact, column rank is equal to row rank in a matrix, and we will prove it later.

⊛

Theorem 1.8.3 (rank and nullity theorem)**.** Suppose $T : V \to W$ is a linear map, then

$$\nu(T) + \operatorname{rank} T = \dim V.$$

Proof. Since $\ker T \subseteq V$, so take a basis $\{v_1, \ldots, v_\nu\}$ of $\ker T$, and $\operatorname{Im} T \subseteq W$, so take a basis $\{w_1, \ldots, w_r\}$ of $\operatorname{Im} T$. Take u_j s.t. $T(u_j) = w_j$.

> **Claim 1.8.1.** $S = \{v_1, \ldots, v_\nu, u_1, \ldots, u_r\}$ forms a basis of V.
>
> **Proof.** We first show that S is linearly independent. Suppose $\sum \alpha_i v_i + \sum \beta_j u_j = 0$. Apply T on it, we get
>
> $$0 = \sum \alpha_i T(v_i) + \sum \beta_j T(u_j) = \sum \alpha_i T(v_i) + \sum \beta_j w_j = \sum \beta_j w_j.$$
>
> However, $\{w_j\}$ is linearly independent, so $\beta_j = 0$ for all j. Now we know $\sum \alpha_i v_i = 0$, which means $\alpha_i = 0$ for all i, so S is linearly independent. Now we want to show $\langle S \rangle = V$. Given $v \in V$, we know $T(v) \in \operatorname{Im} T$, and thus we can represent it as $T(v) = \sum \beta_j w_j$. We want to show
>
> $$v = \sum \alpha_i v_i + \sum \beta_j u_j.$$
>
> Thus, we want to show $v - \sum \beta_j u_j \in \ker T$, but note that
>
> $$T\left(v - \sum \beta_j u_j\right) = T(v) - \sum \beta_j w_j = \sum \beta_j w_j - \sum \beta_j w_j = 0,$$
>
> so we're done, and thus we have
>
> $$v - \sum \beta_j u_j = \sum \alpha_i v_i$$
>
> for some α_i's, and we're done. ⊛
>
> Hence, $\dim V = |S| = \nu T + \operatorname{rank} T$. ∎

Remark 1.8.6. If $\dim V > \dim W$, then $\nu(T) > 0$. Since, $\operatorname{rank} T \le \dim W$, so if $\dim V > \dim W$, then we have $\nu(T) = \dim V - \operatorname{rank} T \ge \dim V - \dim W > 0$.

As previously seen. A map $f : X \to Y$ is called one-to-one or 1-1 or injective if $f(x_1) = f(x_2)$ implies $x_1 = x_2$. f is called onto, surjective if $f(X) = Y$. f is called bijective if it is both 1-1 and onto. In this case, there is the inverse map $f^{-1} : Y \to X$ with $y \mapsto x$ if $f(x) = y$.

Proposition 1.8.3. Let $T : V \to W$ be linear, then T is injective iff $\ker T = \{0\}$.

Proof.

($\Rightarrow$) If $v \in \ker T$, then since $T(0) = 0$, so $v = 0$.

($\Leftarrow$) If $T(v_1) = T(v_2)$, then $T(v_1 - v_2) = 0$, which means $v_1 - v_2 \in \ker T = \{0\}$, so $v_1 = v_2$, which means T is linear.

∎

Proposition 1.8.4. If $T : V \to W$ is a linear map, and if b is a basis of V, then T is injective if and only if $T(b)$ is linearly independent.

Proof.

($\Rightarrow$) Suppose $v_1, v_2, \ldots, v_n$ is a basis of V and we want to show $T(v_1), \ldots, T(v_n)$ is linearly inde-

pendent. Suppose $\sum \alpha_i T(v_i) = 0$, then $T\left(\sum \alpha_i v_i\right) = 0$, so $\sum \alpha_i v_i = 0$, and thus $\alpha_i = 0$ for all i.

($\Leftarrow$) T sends one particular basis $v_1, \ldots, v_n$ to a linearly independent set. We want to show $\ker T = \{0\}$. Suppose $v \in \ker T$, then if $v = \sum \alpha_i v_i$, we have

$$0 = T\left(\sum \alpha_i v_i\right) = \sum \alpha_i T(v_i),$$

but since $\{T(v_i)\}$ is linearly independent, so $\alpha_i = 0$ for all i, which means $v = 0$.

$\blacksquare$

Proposition 1.8.5. If $T : V \to W$ is a linear map, then TFAE

(a) T is surjective

(b) T sends any basis to a generating set.

(c) T sends one basis to a generating set.

Theorem 1.8.4 (isomorphism)**.** Suppose $T : V \to W$ is linear and bijective, then there is the inverse map $T^{-1} : W \to V$, and T^{-1} is also linear. In this case, $T : V \to W$ is called an isomorphism.

Definition 1.8.6. If T is both injective and surjective, then T is an isomorphism.

Remark 1.8.7. If there is an isomorphism from V to W, we say V is isomorphic to W, or V and W are isomorphic.

Example 1.8.6 (Coordinates)**.** If $\dim V = n$, then V is isomorphic to F^n, we write $V \simeq F^n$.

Proof. In fact, given an order basis $B = \{v_1, \ldots, v_n\}$ of V, then we know $v = \sum_{i=1}^n \alpha_i v_i$, where

$$v = \sum_{i=1}^n \alpha_i v_i \mapsto [v]_B = \begin{pmatrix} \alpha_1 \\ \vdots \\ \alpha_n \end{pmatrix},$$

and this is a bijection. Note that this map is well-defined since any v has unique coordinate under B. Hence, we have $v_i \mapsto [v_i]_B = e_i$. $\circledast$

Hence, if $T : V \to W$, and we know $V \simeq F^n$ and $W \simeq F^m$, and we know there is a matrix sends F^n to F^m, called $[T]_{B'}^B$, and we can use it to represent the transformation from V to W, which is T.

Exercise 1.8.1. $T^{-1}(w_1 + w_2) = T^{-1}(w_1) + T^{-1}(w_2)$.

Proof. Suppose $T(v_3) = w_1 + w_2$, we want to show $v_3 = v_1 + v_2$. Hence, we need to check

$$w_1 + w_2 = T\left(T^{-1}(w_1) + T^{-1}(w_2)\right) = T\left(T^{-1}(w_1)\right) + T\left(T^{-1}(w_2)\right) = w_1 + w_2,$$

which is true.

$\blacksquare$

Lecture 6

As previously seen. T is called an isomorphism if T is both injective and surjective.

19 Sep. 10:20

Proposition 1.8.6. Suppose $\dim V = \dim W = n$, then TFAE

  (i) T is an isomorphism.

  (ii) T is injective.

  (iii) T is surjective.

  (iv) T sends any basis of V to a basis of W.

  (v) T sends one basis to a basis.

Example 1.8.7. Suppose $A \in M_{m \times n}(F)$, say $A = (c_1, c_2, \ldots, c_n)$, then T_A is injective if and only if $\{c_1, \ldots, c_n\}$ is linearly independent. (which means $n \leq m$).

Proof. Since $T_A(e_i) = c_i$ and $\{e_i\}_{i=1}^n$ forms a basis.   ⊛

Example 1.8.8. Following the last example, T_A is surjective if and only if $\{c_1, c_2, \ldots, c_n\}$ spans W. (which means $n \geq m$).

1.9   Space of linear maps

Consider

$$\{f : V \to W\},$$

and then we can define addition and multiplication by

$$(f + g)(v) = f(v) + g(v) \quad (\alpha \cdot f)(v) = \alpha f(v).$$

Hence, we know it is a vector space. Now if we collect all linear maps, say

$$\mathcal{L}(V, W) = \{\text{linear } T : V \to W\}.$$

Observe that $\mathcal{L}(V, W)$ is a vector space since we can similarly define the addition and multiplication.

Now if we have U, V, W, three vector spaces, and $f : U \to V$ is a linear map, then if we define a map

$$R_f : \mathcal{L}(V, W) \to \mathcal{L}(U, W)$$
$$T \mapsto T \circ f,$$

then this map is linear. Similarly,

$$L_f : \mathcal{L}(W, U) \to \mathcal{L}(W, V)$$
$$T \mapsto f \circ T,$$

then this is also a linear map.

Note 1.9.1. We just need to check something like

$$R_f(T + S) = R_f(T) + R_f(S) \quad R_f(\alpha T) = \alpha R_f(T).$$

Now if we consider

$$\mathcal{L}(V, W) \times \mathcal{L}(U, V) \to \mathcal{L}(U, W)$$
$$(T, S) \mapsto T \circ S,$$

then this is also a linear map.

Example 1.9.1. $\mathcal{L}(F^n, F^m) = M_{m \times n}(F)$.

Proof. Check that
$$T_A + T_B = T_{A+B}.$$

> **Note 1.9.2.** More precisely, they are isomorphic, that is, $\mathcal{L}(F^n, F^m) \cong M_{m \times n}(F)$.

⊛

Example 1.9.2. Consider
$$\mathcal{L}(F^n, F^m) \times \mathcal{L}(F^p, F^n) \to \mathcal{L}(F^p, F^m),$$
we know this is a linear map, and by Example 1.9.1, we know
$$M_{m \times n}(F) \times M_{n \times p}(F) \to M_{m \times p}(F)$$
is a linear map.

Proof. Check
$$(T_A \circ T_B)(v) = T_{AB}(v) \Leftrightarrow A(Bv) = (AB)(v).$$
⊛

Definition 1.9.1. We call
$$V \cong F^n$$
a basic isomorphisms if $\dim V = n$.

Corollary 1.9.1. $\mathcal{L}(F^n, F^m) \cong M_{m \times n}(F)$.

> **Remark 1.9.1.** If you change F^n to V and F^m to W, then this is also correct since $F^n \cong V$ and $F^m \cong W$. (We suppose $\dim V = n$ and $\dim W = m$.)

Lecture 7

24 Sep. 10:20

There is a special case,
$$\mathcal{L}(V, V) := \mathcal{L}(V) = \{\text{linear } T : V \to V\},$$
which is the space of linear operators on V.

Now consider linear $T_A : F^n \to F^m, T_B : F^p \to F^m$, then we can define a map $T_{AB} = T_A \circ T_B$, and it will be a linear map.

$$
\begin{array}{ccc}
F^p & & \\
\big\downarrow{\scriptstyle T_B} & \searrow{\scriptstyle T_A \circ T_B = T_{AB}} & \\
F^n & \xrightarrow[\;T_A\;]{} & F^m
\end{array}
$$

Also, note that T_A, T_B corresponds to two matrices A, B, respectively, and it turns out that T_{AB} corresponds to the matrix AB. (Check)

Hence, $\mathcal{L}(F^n) = M_n(F)$.

A matrix P is called invertible if T_P is bijective. In this case,

$$
F^n \;\underset{T_Q}{\overset{T_P}{\rightleftarrows}}\; F^m
$$

Hence, there exists $Q \in M_n(F)$ s.t. $QP = PQ = I_n$ since we know $T_P \circ T_Q = T_Q \circ T_P = I$.

Thus, we have
$$
P = (c_1, c_2, \dots, c_n) \text{ invertible} \Leftrightarrow \{c_1, \dots, c_n\} \text{ is a basis.}
$$

by Proposition 1.8.6.

1.10 Map/matrix correspondence

$$
\begin{array}{ccc}
V & \xrightarrow{\;\;T\;\;} & W \\
\big\downarrow{\scriptstyle [\cdot]_B} & \circlearrowleft & \big\downarrow{\scriptstyle [\cdot]_{B'}} \\
F^n & \xrightarrow[\text{What is this?}]{} & F^m
\end{array}
$$

Take an ordered basis $B = \{v_1, v_2, \dots, v_n\}$ and $B' = \{w_1, \dots, w_m\}$, and says

$$
T(v_j) = \sum_{i=1}^{m} \alpha_{ij} w_i \mapsto \begin{pmatrix} \alpha_{1j} \\ \vdots \\ \alpha_{mj} \end{pmatrix}.
$$

Now consider the matrix

$$
A = (\alpha_{ij}) = \left([T(v_1)]_{B'}, [T(v_2)]_{B'}, \dots\right),
$$

and then we called A the martix of T relative to B and B'. (matrix representative of T), and we denote this by $[T]_{B'}^B$.

> **Theorem 1.10.1.**
> $$
> [T(v)]_{B'} = [T]_{B'}^B [v]_B.
> $$

> **Theorem 1.10.2.** We have $[\cdot]_{B'}^B : \mathcal{L}(V, W) \to M_{m \times n}(F)$, ans this matrix representative $[\cdot]_{B'}^B$ is an isomorphism, which means
>
> - $[T + S]_{B'}^B = [T]_{B'}^B + [S]_{B'}^B$.
>
> - It is bijective.

Corollary 1.10.1. if $\dim V = n$ and $\dim W = m$, then

$$\dim(\mathcal{L}(V, W)) = \dim V \cdot \dim W.$$

Theorem 1.10.3.
$$[T]^B_{B'}[S]^{B''}_B = [T \circ S]^{B''}_{B'}.$$

Special case:

$$\mathcal{L}(V) \to M_n(F).$$

Take an ordered basis $B = \{v_1, \ldots, v_n\}$. If $T \in \mathcal{L}(V)$, then we can define $[T]_B = [T]^B_B$.

Corollary 1.10.2. Given $T : V \to W$. There are $B = \{v_1, \ldots, v_n\}$ and $B' = \{w_1, \ldots, w_m\}$ where B is a basis of V and B' is a basis of W and

$$[T]^B_{B'} = \begin{pmatrix} I_p & 0 \\ 0 & 0 \end{pmatrix},$$

where $p = \text{rank}(T)$.

Proof. We can let $B = \{v_1, \ldots, v_r, v_{r+1}, \ldots, v_n\}$, where $\{v_{r+1}, \ldots, v_n\}$ is a basis of $\ker T$ and $T(v_1), \ldots, T(v_r)$ is a basis of $\text{Im}(T)$, (Recall the proof in Theorem 1.8.3), then we can let $B' = \{T(v_1), \ldots, T(v_r), \ldots\}$. ∎

Example 1.10.1. Suppose $V = \{\text{polynomials with degree} \leq k\}$ and W is the space of polynomials with degree $\leq k + 1$, then if $T : V \to W$ and $p(x) \mapsto \int_0^x p(t)\,dt$, then we know an ordered basis $B = \{1, x, x^2, \ldots, x^k\}$ and $B' = \{1, x, x^2, \ldots, x^{k+1}\}$, and then

$$[T]^B_{B'} = \begin{pmatrix} 0 & 0 & & & \\ 1 & 0 & & & \\ 0 & \frac{1}{2} & & & \\ \vdots & 0 & \ddots & & 0 \\ \vdots & & & & \\ 0 & 0 & & & \frac{1}{k+1} \end{pmatrix}.$$

Example 1.10.2. Suppose V is the space of polynomials of degree $\leq k$, and $B = \{1, x, x^j, \ldots, x^k\}$, and $B' = \{1, y, y^2, \ldots, y^k\}$ with $y = x - 1$. Then, if T is the identity transformation, note that

$$x^j = (y + 1)^j = 1 + j \cdot y + \binom{j}{2}y^2 + \cdots + \binom{j}{j}y^j.$$

Hence, we have

$$[T]_{B'}^B = \begin{pmatrix} \binom{0}{0} & \binom{1}{0} & \binom{2}{0} & \\ 0 & \binom{1}{1} & \binom{2}{1} & \\ 0 & 0 & \binom{2}{2} & \\ \vdots & \vdots & & \ddots \\ 0 & 0 & & \end{pmatrix}$$

Question. Given V, and B, B' are ordered basis, then what is the relation between $[v]_B$ and $[v]_{B'}$?

Answer. Change of bases. ✳

Corollary 1.10.3.
$$[id]_{B'}^B [v]_B = [v]_{B'}.$$

Corollary 1.10.4.
$$[id]_{B'}^B [id]_B^{B'} = [id]_{B'}^{B'}.$$

Corollary 1.10.5. Given any $A \in M_{m \times n}(F)$. There are invertible matrices $P \in M_m(F)$ and $Q \in M_n(F)$ s.t.
$$PAQ = \begin{pmatrix} I_p & 0 \\ 0 & 0 \end{pmatrix},$$
where p is the row rank of A.

Proof. Suppose $A = [T]_B^{B'}$, and by Corollary 1.10.2, we know there exists b, b' s.t. $[T]_b^{b'}$ is the matrix we want, then we can let $Q = [id]_{b'}^{B'}$ and $P = [id]_b^B$, and we're done. ∎

Lecture 8

Lemma 1.10.1. Consider

$$V' \xrightarrow{\ f\ } V \xrightarrow{\ T\ } W \xrightarrow{\ g\ } W'$$

- Suppose g is injective, then $\ker(g \circ T) = \ker T$.
- Suppose f is surjective, then $\mathrm{Im}(T \circ f) = \mathrm{Im}\, T$.

26 Sep. 10:20

Definition 1.10.1 (Matrix Equivalence). Let $A, B \in M_{m \times n}(\mathbb{F})$. We say that A and B are *equivalent* if there exist invertible matrices $P \in GL_m(\mathbb{F})$ and $Q \in GL_n(\mathbb{F})$ such that
$$B = PAQ.$$

Remark 1.10.1. Matrix equivalence means that one can obtain B from A by a sequence of invertible row and column operations.

Equivalently, if A represents a linear map $T : \mathbb{F}^n \to \mathbb{F}^m$, then B represents the same linear map with respect to different bases of the domain and codomain.

Theorem 1.10.4 (Row Rank Equals Column Rank). Let $A \in M_{m \times n}(\mathbb{F})$ be any matrix over a field $\mathbb{F}$. Then
$$\text{row rank}(A) = \text{column rank}(A).$$

Proof. We prove this using invertible row and column operations.

Step 1: Reduce A to canonical form.

It is a standard fact that any matrix $A \in M_{m \times n}(\mathbb{F})$ can be transformed into a block matrix of the form

$$C = \begin{bmatrix} I_r & 0 \\ 0 & 0 \end{bmatrix}_{m \times n},$$

by multiplying on the left and right by invertible matrices $P \in GL_m(\mathbb{F})$ and $Q \in GL_n(\mathbb{F})$:

$$C = PAQ.$$

Here $r = \operatorname{rank}(A)$ and I_r is the $r \times r$ identity matrix. This uses Gaussian elimination (invertible row operations) and invertible column operations.

Step 2: Row and column ranks of C.

- The first r rows of C are linearly independent, and the remaining $m - r$ rows are zero. So

$$\text{row rank}(C) = r.$$

- The first r columns of C are linearly independent, and the remaining $n - r$ columns are zero. So

$$\text{column rank}(C) = r.$$

Step 3: Equivalence preserves row and column ranks.

We have $C = PAQ$.

1. *Left multiplication by P (row operations):* Multiplying A on the left by invertible P corresponds to invertible row operations. Row operations do not change the linear independence of the rows. Hence

$$\text{row rank}(PA) = \text{row rank}(A).$$

2. *Right multiplication by Q (column operations):* Each row of AQ is obtained by multiplying the corresponding row of A by Q:

$$\text{row}_i(AQ) = \text{row}_i(A) \cdot Q.$$

Since Q is invertible, this is an invertible linear transformation on $\mathbb{F}^n$, which preserves linear independence of the rows. Therefore

$$\text{row rank}(AQ) = \text{row rank}(A).$$

> **Note 1.10.1.**
>
> $$\sum_{i \in I} \alpha_i \text{row}_i(A) \cdot Q = 0 \Leftrightarrow \sum_{i \in I} \alpha_i \text{row}_i(A) = 0$$
>
> since Q is invertible.

Combining the above, for $C = PAQ$ we get

$$\text{row rank}(C) = \text{row rank}(A) = r,$$

and similarly

$$\text{column rank}(C) = \text{column rank}(A) = r.$$

Step 4: Conclusion.

From Step 2 and Step 3, we have

$$\text{row rank}(A) = \text{row rank}(C) = r = \text{column rank}(C) = \text{column rank}(A).$$

Hence, the row rank of A equals the column rank of A. ∎

Theorem 1.10.5. Two matrices A and B of same sizes are equivalent if and only if $\mathrm{rank}(A) = \mathrm{rank}(B)$.

Proof. Suppose A, B equivalent, then $A = PBQ$ for some invertible P, Q. By Lemma 1.10.1, we know $\mathrm{Im}(BQ) = \mathrm{Im}\,B$, which gives $\mathrm{rank}(BQ) = \mathrm{rank}\,B$. Also, since $\ker(P(BQ)) = \ker(BQ)$, so $\mathrm{rank}(P(BQ)) = \mathrm{rank}(BQ)$ by rank and nullity theorem. Hence, we have $\mathrm{rank}\,A = \mathrm{rank}(PBQ) = \mathrm{rank}(BQ) = \mathrm{rank}\,B$.

Now if $\mathrm{rank}\,A = \mathrm{rank}\,B$, then we know

$$PAQ = \begin{pmatrix} I_r & 0 \\ 0 & 0 \end{pmatrix} = P'BQ',$$

so $A = P^{-1}P'BQ'Q^{-1}$, which means A, B are equivalent. ∎

Theorem 1.10.6. Let $T : V \to W$ be a linear transformation between finite-dimensional vector spaces over a field $\mathbb{F}$. Let $B = \{v_1, \ldots, v_n\}$ be a basis for V and $C = \{w_1, \ldots, w_m\}$ be a basis for W. Let

$$A = [T]_{B,C} \in M_{m \times n}(\mathbb{F})$$

be the matrix of T with respect to the bases B and C. Then

$$\mathrm{rank}(A) = \dim(\mathrm{Im}(T)).$$

Proof. Step 1: Express the image of T in terms of the basis.
The matrix A is given by

$$A = \begin{bmatrix} [T(v_1)]_C & [T(v_2)]_C & \ldots & [T(v_n)]_C \end{bmatrix},$$

where $[T(v_j)]_C$ denotes the coordinate vector of $T(v_j)$ with respect to C.

Since B is a basis for V, any vector $v \in V$ can be written as

$$v = c_1 v_1 + c_2 v_2 + \cdots + c_n v_n$$

for some scalars $c_1, \ldots, c_n \in \mathbb{F}$. By linearity of T,

$$T(v) = c_1 T(v_1) + c_2 T(v_2) + \cdots + c_n T(v_n).$$

Thus, every vector in $\mathrm{Im}(T)$ is a linear combination of

$$\{T(v_1), T(v_2), \ldots, T(v_n)\},$$

and hence

$$\mathrm{Im}(T) = \mathrm{span}\{T(v_1), T(v_2), \ldots, T(v_n)\}.$$

Step 2: Relate $\mathrm{Im}(T)$ to the column space of A.
The column space of A, denoted $\mathrm{Col}(A)$, is

$$\mathrm{Col}(A) = \mathrm{span}\{[T(v_1)]_C, [T(v_2)]_C, \ldots, [T(v_n)]_C\}.$$

The coordinate mapping $[\cdot]_C : W \to \mathbb{F}^m$ is a linear isomorphism. In particular, it preserves linear independence and spanning sets. Therefore, the map

$$T(v_j) \longmapsto [T(v_j)]_C$$

establishes a linear isomorphism between $\mathrm{Im}(T)$ and $\mathrm{Col}(A)$:

$$\mathrm{Im}(T) \cong \mathrm{Col}(A).$$

Step 3: Compare dimensions.

Since isomorphic vector spaces have the same dimension,

$$\dim(\text{Im}(T)) = \dim(\text{Col}(A)).$$

By definition, the rank of A is the dimension of its column space:

$$\text{rank}(A) = \dim(\text{Col}(A)).$$

Combining these equalities, we obtain

$$\text{rank}(A) = \dim(\text{Im}(T)),$$

as desired.

This shows that the rank of a matrix representing a linear transformation is independent of the choice of bases B and C, since $\dim(\text{Im}(T))$ depends only on T itself. ∎

Lecture 9

Consider the system

$$\begin{cases} a_{11}x_1 + \cdots + a_{1n}x_n = y_1 \\ \vdots \\ a_{m1}x_1 + \cdots + a_{mn}x_n = y_m. \end{cases}$$

We want to solve X s.t. $AX = Y$, where $A = (a_{ij})_{m \times n}$ and $Y = (y_i)_{i=1}^m$. Suppose $P \in M_{m \times m}(F)$ invertible, then if $B = PA$, we have $BX = Z$, which means doing row operations on the system. In this case, we call two systems are equivalent. We also call A, B are row equivalent.

Now we talk about the types of elementary row operations:

(i) Replace i-th row with $c \cdot r_i$ for some $c \neq 0$.

(ii) Replace r_i with $r_i + cr_j$ for some $j \neq i$.

(iii) Interchange r_i and r_j for some $i \neq j$.

One can use (i) and (ii) in finite steps, making A into row reduced form(REF) of A, which means

- first entry of a non-zero row is 1, we called it leading 1

- entries below and above leading 1 are 0.

If allowing (iii), we can make A into RREF(row reduced echelon form), which means REF and all zero rows are at the bottom.

Note that $AX = Y$ gives $PAX = PY$, so we can write $P(A \mid Y) = (PA \mid PY)$. Hence, we can do row operations on $(X \mid Y)$ so that the X part becomes REF or RREF to solve the system. The system will be like

$$x_{k_1} + \cdots + 0 + \cdots = z_1$$
$$x_{k_2} + \cdots + 0 = z_2$$
$$\vdots$$

Suppose for the first n rows, there are r non-zero rows. If there is some $z_i \neq 0$ for $i > r$, the system has no solution. If not, there is at least one solution, and there are $n - r$ free variables.

Note 1.10.2. If $n - r = 0$, then the system has unique solution, and if $n - r > 0$, then it has infinitely many solutions.

In the homogeneous case (i.e. $y_1 = y_2 = \cdots = y_m = 0$), we find $\nu(A) = n - r$. In this case, if $n > m$, then $n - r > m - r \geq 0$, so there are non-zero solutions to $AX = 0$.

Some consequences:

- If $A \in M_n(F)$, then TFAE

  - The system $AX = 0$ has only trivial solution (injective).
  - For any Y, $AX = Y$ has a (unique) solution (surjective).
  - A is invertible.

If P, Q are invertible, then $(PQ)^{-1} = Q^{-1}P^{-1}$. Also, by above mentioned things, we know every invertible matrix is a product of many elementary matrix, that is, $A = (E_1)^{-1}(E_2)^{-1}\ldots(E_m)^{-1}$ since we know

$$(E_m \ldots E_2 E_1)A = I_m.$$

> **Note 1.10.3.** If A is invertible, then $AX = 0$ has only trivial solution, then its RREF is I, and thus A can be recovered to I by some row operations.

> **As previously seen.** If $\{v_1, \ldots, v_n\}$ is linearly independent and $\{w_1, \ldots, w_m\}$ spans V, then $n \leq m$.

Suppose $x_1 v_1 + \cdots + x_n v_n = 0$, where

$$v_i = a_{1i}w_1 + a_{2i}w_2 + \cdots + a_{mi}w_m,$$

then we have

$$a_{i1}x_1 + \cdots + a_{im}x_n = 0$$

for all $1 \leq i \leq m$. If $n > m$, then there exists a non-zero solution to this system, which contradicts to the fact that $x_1 = x_2 = \cdots = x_n = 0$.

> **Corollary 1.10.6.** For $A \in M_{m \times n}(F)$, we know there exists invertible P, Q s.t.
>
> $$PAQ = \begin{bmatrix} I_r & 0 \\ 0 & 0 \end{bmatrix}.$$

> **Corollary 1.10.7.** row rank is equal to col rank.

> **Question.** How to show A invertible?

> **Answer.** Check RREF of A is I_n or not. ⊛

> **Question.** How to find A^{-1}?

> **Answer.** Calculate $(A \mid I_n)$. ⊛

Chapter 2

Dual space

Consider a vector space V, and V is over a field F, then we call

$$V^* = \mathcal{L}(V, F).$$

Definition 2.0.1. Suppose V is a vector space over F (with basis $\{1\}$), then

- A linear functional f is a linear map $f : V \to F$.
- $V^* = \mathcal{L}(V, F)$ is called the dual space of V.

Example 2.0.1. Suppose $V = F^n$, then $V^* = M_{1 \times n}(F)$.

Note that Suppose $f \in V^*$ corresponds to $(a_1, a_2, \ldots, a_n)$, then $f(e_i) = a_i$.

Example 2.0.2. Suppose $V = M_{n \times n}(F)$, then the tract map

$$\mathrm{tr} : M_{n \times n}(F) \to F \quad (a_{ij}) \mapsto \sum_{i=1}^{n} a_{ii}$$

is in V^*.

Example 2.0.3. We can define $E_{pq}^* \in V^*$ by

$$E_{pq}^*((a_{ij})) = a_{pq},$$

then $\left\{ E_{ij}^* \right\}$ is a basis of V^*.

Example 2.0.4. Suppose

$$V = \{\text{continuous function } f : [p, q] \to \mathbb{R}\},$$

then we can define ev_s, the evaluation at s, by

$$\mathrm{ev}_s(f) = f(s),$$

and we can define $I : V \to \mathbb{R}$ with

$$I(f) = \int_p^q f(x)\,\mathrm{d}x,$$

then ev_s and I are both elements of V^*.

Lecture 10

Definition 2.0.2. $A, B \in M_n(F)$ are called similar or $A \sim B$ iff $B = P^{-1}AP$.

Notation. We call $\mathcal{L}(V, F)$
$$V^* \quad \text{or} \quad V^\vee \quad \text{or} \quad V^t.$$

Theorem 2.0.1.
$$\dim V = \dim V^*.$$

Matrix relation proof. Since $V^* \simeq M_{1 \times n}(F)$, where $n = \dim V$, so
$$\dim V^* = \dim M_{1 \times n}(F) = n = \dim V.$$

$\blacksquare$

Proof. Suppose $B = \{v_1, v_2, \ldots, v_n\}$ is a basis of V, and define $B^* = \{v_1^*, v_2^*, \ldots, v_n^*\}$ as
$$v_i^*(v_j) = \delta_{ij}.$$
Note that $v_i^* \in \mathcal{L}(V, F)$ for all i. Note that for all $v = \sum_{i=1}^n \alpha_i v_i$, we have
$$v_i^*(v) = \alpha_i.$$
Check B^* is linearly independent: Suppose $f = \sum \alpha_i v_i^* = 0$, then we know $f(v_j) = \alpha_j = 0$ for all j. Also, note that B^* spans V^*. $\blacksquare$

Remark 2.0.1.
$$[v]_B = \begin{pmatrix} v_1^*(v) \\ \vdots \\ v_n^*(v) \end{pmatrix}$$

Example 2.0.5. Suppose $V = F^2$ and $B = \{e_1, e_2\}$, then V^* is identified with
$$\mathcal{L}\left(F^2, F\right) = M_{1 \times 2}(F),$$
where $B^* = \{e_1^*, e_2^*\}$ with
$$e_1^* = (1, 0) \quad e_2^* = (0, 1).$$

Now if we know $T : V \to W$ is a linear map, then we can define $T^* : W^* \to V^*$ by
$$T^* : f \mapsto f \circ T,$$
and we called it the transpose of T. We will show that if $[T]_C^B = M$, then $[T^*]_{B^*}^{C^*} = N = M^t$, which means if $M = (m_{ij})_{m \times n}$ and $N = (n_{ij})_{n \times m}$, then $n_{ij} = m_{ji}$ for all i, j with $1 \leq i \leq n$ and $1 \leq j \leq m$.

Proof. Suppose $T^*\left(w_j^*\right) = \sum_{p=1}^n n_{pj} v_p^*$, then since
$$w_j^*(T(v_j)) = w_j^*\left(\sum_{q=1}^m m_{qi} w_q\right) = m_{ji},$$
so $n_{ij} = m_{ji}$. (See Remark 2.0.1) Note that the below one is the evaluation of the above equation at v_j. $\blacksquare$

Lecture 11

Definition 2.0.3 (Annihilator). Let $S \subseteq V$ be a subset, then the annihilator $S^0 \subseteq V^*$ is the subset defined by
$$\{f \in V^* \mid f(x) = 0 \quad \forall x \in V\}.$$

Proposition 2.0.1. For all $S \subseteq V$, S^0 is a subspace of V^*.

Proof. For all $f, g \in S^0$, we know
$$(cf + g)(x) = cf(x) + g(x) = 0 \quad \forall x \in V,$$
so $cf + g \in S^0$. ∎

Example 2.0.6. $\{0\}^0 = V^*$ and $V^0 = \{0\}$.

Proposition 2.0.2. If $S_1 \subseteq S_2$, then $S_2^0 \subseteq S_1^0$.

Proof. If $f \in S_2^0$, then $f(x) = 0$ for all $x \in S_2$, so $f(x) = 0$ for all $x \in S_1$, and thus $f \in S_1^0$, which means $S_2^0 \subseteq S_1^0$. ∎

Proposition 2.0.3. If $W = \langle S \rangle$, then $W^0 = S^0$.

Proof. Since $S \subseteq W$, so we know $W^0 \subseteq S^0$ by Proposition 2.0.2. Also, for all $f \in S^0$, we know for all $x \in \langle S \rangle$, $x = \sum \alpha_i x_i$ where x_i's are elements of S, so
$$f(x) = f\left(\sum \alpha_i x_i\right) = \sum \alpha_i f(x_i) = 0,$$
which means $S^0 \subseteq W^0$. ∎

Example 2.0.7. Suppose $W_1 \subseteq W_2 \subseteq V$, then $W_1^0 \supseteq W_2^0 \supseteq V^0$.

Proposition 2.0.4. Suppose V is finite dimensional and $W \subseteq V$, then $\dim W + \dim W^0 = \dim V = \dim V^*$.

Proof. Let $\dim W = m$ and $\dim V = n$, and take $B = \{w_1, \ldots, w_m\}$ a basis of W and $C = \{w_1, \ldots, w_m, v_{m+1}, \ldots, v_n\}$ as a basis of V. If we take dual of C, suppose
$$C^* = \left\{w_1^*, w_2^*, \ldots, w_m^*, v_{m+1}^*, \ldots, v_n^*\right\},$$
and now we claim $\{v_{m+1}^*, \ldots, v_n^*\}$ is a basis of W^0. For all $f \in V^*$, we know $f = \sum_{i=1}^{m} \alpha_i w_i^* + \sum_{j=m+1}^{n} \beta_j v_j^*$. Now if $f \in W^0$, then we know $f(w) = 0$ for all $w \in W$, so $f(w_i) = 0$ for all w_i's, and thus
$$f(w_i) = \sum_{i=1}^{m} \alpha_i w_i^*(w_i) + \sum_{j=m+1}^{n} \beta_j v_j^*(w_i) = \alpha_i = 0,$$
so we know $f = \sum_{j=m+1}^{n} \beta_j v_j^*$, which means $f \in \langle v_{m+1}^*, \ldots, v_n^* \rangle$. Thus, $W^0 \subseteq \langle v_{m+1}^*, \ldots, v_n^* \rangle$ Also, $v_i^*(w) = 0$ for all $w \in W$, so we know $\langle v_{m+1}^*, \ldots, v_n^* \rangle \subseteq W^0$, and we're done. ∎

Corollary 2.0.1. If $\dim V, \dim W < \infty$ and $T : V \to W$ is linear, and we define $T^* : W^* \to V^*$ as T's transpose, then $\operatorname{rank} T = \operatorname{rank} T^*$.

Proof. First we show that $\ker T^* = (\operatorname{Im} T)^0$. Suppose $f \in \ker T^*$, then
$$0 = T^*(f) = fT,$$

so $fT(v) = 0$ for all $v \in V$, so $f(w) = 0$ for all $w \in \operatorname{Im} T$, so $f \in (\operatorname{Im} T)^0$. Conversely, we can similarly show that $(\operatorname{Im} T)^0 \subseteq \ker T^*$, and we're done. Note that

$$\dim W^* - \operatorname{rank} T^* = \nu\left(T^*\right) = \dim\left(\operatorname{Im}(T)^0\right) = \dim W - \dim(\operatorname{Im} T) = \dim W - \operatorname{rank} T,$$

and since $\dim W = \dim W^*$, so we know $\operatorname{rank} T = \operatorname{rank} T^*$. $\blacksquare$

Corollary 2.0.2. Suppose A is a matrix, then its row rank and column rank are same.

Proof. By regarding A as a linear map T's corresponding matrix, then T^*'s corresponding matrix is A^t, and since we have shown that $\operatorname{rank} T = \operatorname{rank} T^*$, so A's row rank is equal to A^t's row rank, which is A's column rank. $\blacksquare$

2.1 Dual of Dual space/Evaluation

We first define that $V^{**} = (V^*)^*$, and we can define a linear map

$$\operatorname{ev} : V \to V^{**}, \quad x \mapsto \widetilde{x},$$

where $\widetilde{x}$ is the functional

$$\widetilde{x} : V^* \to F \quad f \mapsto f(x).$$

Theorem 2.1.1. ev is an isomorphism between V and V^{**}.

Proof. We can check $\widetilde{x}, \operatorname{ev}$ are linear easily. DIY

Lemma 2.1.1. If $v \in V$ is not zero, then there exists $f \in V^*$ s.t. $f(v) \neq 0$.

Proof. Take $B = \{v_1 = v, v_2, \ldots, v_n\}$ as a basis of V and take dual B^*, then $v_1^*(v) = 1$. $\blacksquare$

Claim 2.1.1. $\operatorname{ev} : V \to V^{**}$ is injective.

Proof. Suppose $v \in \ker \operatorname{ev}$, then $\widetilde{v} = 0$, which means $f(v) = 0$ for all $f \in V^*$, so $v = 0$ by Lemma 2.1.1, and thus ev is injective. $\blacksquare$

Since $\dim V = \dim V^* = \dim\left(V^*\right)^* = \dim V^{**}$, so injectivity implies bijectivity. $\blacksquare$

Corollary 2.1.1. If $T : V \to W$ is a linear map with inverse $S : W \to V$, then $T^* : W^* \to V^*$'s inverse is $S^* : V^* \to W^*$, where S^* is the transpose of S.

Corollary 2.1.2 (Matrix ver)**.** Suppose $A \in M_n(F)$ is invertible, then A^t is invertible, and

$$\left(A^t\right)^{-1} = \left(A^{-1}\right)^t.$$

Chapter 3

Eigenvalue and Eigenvector

Lecture 12

Question. If V is a vector space and $\dim V < \infty$, if $T : V \to V$ is a linear map, then is there a basis of V,

$$B = \{v_1, v_2, \ldots, v_n\}$$

s.t. $T(v_i) = \lambda_i v_i$ for some $\lambda_i \in F$ i.e.

$$[T]_B = \begin{pmatrix} \lambda_1 & 0 & \cdots & 0 \\ 0 & \lambda_2 & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \cdots & \lambda_n \end{pmatrix}.$$

Note that this question is equivalent to find some linearly independent $\{v_i\}_{i=1}^n$ s.t.

$$A \underbrace{\begin{pmatrix} v_1 & v_2 & \cdots & v_n \end{pmatrix}}_{P} = \begin{pmatrix} \lambda_1 v_1 & \lambda_2 v_2 & \cdots & \lambda_n v_n \end{pmatrix} = \underbrace{\begin{pmatrix} v_1 & v_2 & \cdots & v_n \end{pmatrix}}_{P} \begin{pmatrix} \lambda_1 & 0 & \cdots & 0 \\ 0 & \lambda_2 & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \cdots & \lambda_n \end{pmatrix},$$

which means is there invertible P s.t. $P^{-1}AP$?

Question. Why we want to diagonalize a matrix?

Answer. If we have $A = PBP^{-1}$, then $A^k = PB^kP^{-1}$, and if B is diagonal, say

$$B = \begin{pmatrix} \lambda_1 & \cdots & 0 \\ \vdots & \ddots & \vdots \\ 0 & \cdots & \lambda_n \end{pmatrix},$$

then

$$B^k = \begin{pmatrix} \lambda_1^k & \cdots & 0 \\ \vdots & \ddots & \vdots \\ 0 & \cdots & \lambda_n^k \end{pmatrix},$$

and it is easy to compute. ⊛

One of the applications of diagonalization is about recurrence relation. If we have a sequence $\{a_i\}_{i=0}^{\infty}$, where

$$a_{k+2} = \alpha a_{k+1} + \beta a_k,$$

then suppose $v_k = (a_k, a_{k+1})^t$, then

$$v_k = \begin{pmatrix} 0 & 1 \\ \alpha & \beta \end{pmatrix} \begin{pmatrix} a_{k-1} \\ a_k \end{pmatrix} = A v_{k-1},$$

so we have $v_k = A^k v_0$, and thus if we know diagonalization, then we can compute A^k quickly.

Now we talk about how to find λ, v s.t. $T(v) = \lambda v$. If $v = 0$, then it is trivial, so we suppose $v \neq 0$, and thus it is equivalent to find λ, v s.t.

$$(T - \lambda I)(v) = 0.$$

Definition 3.0.1 (Singular)**.** A matrix or linear operator is singular if it is not invertible.

Thus, we want to find λ s.t. $T - \lambda I$ is singular since if $T - \lambda I$ is invertible, then $v = 0$.

Definition 3.0.2 (Adjoint of a matrix)**.** If $A \in M_n(F)$, then we define the adjoint of A to be $\mathrm{adj}(A) \in M_n(F)$ where
$$(\mathrm{adj}(A))_{ij} = (-1)^{i+j} \det \left(A \left(j \mid i \right) \right),$$
where $A \left(j \mid i \right)$ is A deleting its j-th row and i-th column.

Note 3.0.1. If we look at $M_2(F)$ and $M_3(F)$, we can find that

$$A \cdot \mathrm{adj}(A) = \det(A) I.$$

In fact, this is true for square matrices of all sizes.

Remark 3.0.1. A is invertible iff $\det(A) \neq 0$.

Proof. We will later show the proof. ∎

We first introduce some good properties:

(1) Multilinear.

(2) Alternating.

(3) $\det(I_n) = 1$.

Definition 3.0.3 (Multilinear)**.** Consider a function D of n row vectors in F^n as its input, and the output is $D(v_1, v_2, \ldots, v_n) \in F$, then D is called multilinear or n-linear if

$$D(u + \alpha w, v_2, \ldots, v_n) = D(u, v_2, \ldots, v_n) + \alpha D(w, v_2, \ldots, v_n)$$

$$\vdots$$

$$D(v_1, v_2, \ldots, u + \alpha w) = D(v_1, v_2, \ldots, u) + \alpha D(v_1, v_2, \ldots, w).$$

Example 3.0.1. If we suppose $A \in M_n(F)$, and r_i is the i-th row of A, where $r_i = (a_{i1}, a_{i2}, \ldots, a_{in})$, then If we define $D(A) = a_{ak_1} a_{2k_2} \ldots a_{nk_n}$, then in fact D is multilinear if we regard D as a function which takes n row vectors as its input.

Lemma 3.0.1. If D_1, D_2 are n-linear, then $D_1 + \alpha D_2$ is also n-linear. If D is n-linear, then D is determined by $D(v_1, \ldots, v_n)$ with $v_i \in \{e_i\}_{i=1}^{n}$.

Note 3.0.2. D is a function determined by n^n values since each v_i has n choices.

Definition 3.0.4 (Alternating)**.** Suppose D is n-linear, then D is alternating if

$$D(v_1, \ldots, v_n) = 0$$

if $v_i = v_j$ for some $i \neq j$.

Lemma 3.0.2. If D is alternating, then

(1)
$$D(\ldots, \overbrace{v_i + \alpha v_j}^{i\text{-th position}}, \ldots) = D(\ldots, \overbrace{v_i}^{i\text{-th position}}, \ldots).$$

(2) If $\{v_1, v_2, \ldots, v_n\}$ is linearly dependent, then $D(v_1, v_2, \ldots, v_n) = 0$.

(3)
$$D(v_1, \ldots, v_i, \ldots, v_j, \ldots, v_n) = -D(v_1, \ldots, v_j, \ldots, v_i, \ldots, v_n).$$

proof of (2). WLOG, say $v_i = \sum_{j \neq i} \alpha_j v_j$, then

$$D(v_1, \ldots, v_n) = D\left(v_1, \ldots, \sum_{j \neq i} \alpha_j v_j, \ldots, v_n\right) = \sum_{j \neq i} \alpha_j D(v_1, \ldots, \overbrace{v_j}^{i\text{-th position}}, \ldots, v_n) = 0$$

since D is alternating.

■

proof of (3). Since

$$
\begin{aligned}
0 &= D(\ldots, v_i + v_j, \ldots, v_i + v_j, \ldots) \\
&= D(\ldots, v_i, \ldots, v_i, \ldots) + D(\ldots, v_i, \ldots, v_j, \ldots) + D(\ldots, v_j, \ldots, v_i, \ldots) + D(\ldots, v_j, \ldots, v_j, \ldots) \\
&= D(\ldots, v_i, \ldots, v_j, \ldots) + D(\ldots, v_j, \ldots, v_i, \ldots),
\end{aligned}
$$

so this is true.

■

Proposition 3.0.1. If D is n-linear and alternating, then it is determined by

$$D\left(e_{\sigma(1)}, e_{\sigma(2)}, \ldots, e_{\sigma(n)}\right),$$

where $\sigma : \{1, 2, \ldots, n\} \to \{1, 2, \ldots, n\}$ is any permutation on $[n]$.

Remark 3.0.2. In this case, there is at most one n-linear alternating D satisfying $D(e_1, \ldots, e_n) = 1$.

Proof. Since D is alternating, so swapping e_i and e_j just turn the original value to negative. Thus, if $D(e_1, \ldots, e_n) = 1$, then we know

$$D\left(e_{\sigma(1)}, e_{\sigma(2)}, \ldots, e_{\sigma(n)}\right)$$

is uniquely defined for all permutation σ. Now since D is determined by $D\left(e_{\sigma(1)}, e_{\sigma(2)}, \ldots, e_{\sigma(n)}\right)$, so D is uniquely defined.

■

Another approach/inductive construction

Theorem 3.0.1. There exists a function

$$\det_n : M_n(F) \to F,$$

s.t. $\det_n$ is n-linear(on rows) and alternating(on rows) and $\det(I_n) = 1$.

We can just define

$$
\begin{cases}
\det_1(a) = a \\
\det_n(A) = \displaystyle\sum_{i=1}^{n} (-1)^{i+j} a_{ij} \det\left(A\left(i \mid j\right)\right)
\end{cases},
$$

where $A(i \mid j)$ is A deleting i-th row and j-th column.

Note 3.0.3. The definition given above is the expansion along j-th column.

Lecture 13

Actually determinant can be defined on ring (we defined it on field before).

Theorem 3.0.2. There is the determinant function

$$\det : M_n(R) \to R.$$

Now we talk more about expansion. We do expansion along a column. Suppose we have

$$\delta : M_{n-1}(R) \to R,$$

which is $(n-1)$-linear and alternating and $\delta(I_{n-1}) = 1$, then if we define $D_j = D : M_n(R) \to R$, which is the expansion along the j-th column, and it has

$$D(A = (a_{ij})) = \sum_{i=1}^n (-1)^{i+j} a_{ij} \delta\left(A(i \mid j)\right).$$

Note 3.0.4. $C_{ij} = (-1)^{i+j} \delta\left(A(i \mid j)\right)$ is called the (i, j)-cofactor.

Theorem 3.0.3. D is n-linear and alternating, and $D(I_n) = 1$.

Proof. ∎ ⎯⎯⎯⎯ DIY

Note 3.0.5. In the proof of alternating, we may need to use Lemma 3.0.2.

Note 3.0.6. We still regard D as a function taking n row vectors as its input.

As previously seen. If $D : M_n(R) \to R$ is n-linear, alternating, then

$$D\left((a_{ij})\right) = \sum_{\sigma} \prod_{i} a_{1\sigma(i)} D \begin{pmatrix} e_{\sigma(1)} \\ \vdots \\ e_{\sigma(n)} \end{pmatrix}$$

Now we put things together:

Theorem 3.0.4.

  (i) There is a function $\det : M_n(R) \to R$ satisfying n-linear, alternating, and $\det(I_n) = 1$.

  (ii) If $D : M_n(R) \to R$ is n-linear, alternating, then $D(A) = D(I) \cdot \det(A)$.

  (iii) For a permutation σ, if $\sigma = t_1 t_2 \dots t_n = t_1' t_2' \dots t_m'$, where t_i, t_i''s are transpositions, then $(-1)^n = (-1)^m$.

Remark 3.0.3. (ii) needs the fact that

$$D\left(e_{\sigma(1)}, e_{\sigma(2)}, \dots, e_{\sigma(n)}\right) = (-1)^m D(e_1, e_2, \dots, e_n)$$

if σ is the composition of m traspositions.

Remark 3.0.4. (i) and (ii) hold for any R.

Now we introduce two formulas:

(1)
$$\det(A) = \sum_{i=1}^{n}(-1)^{i+j}a_{ij}\det\left(A(i\mid j)\right).$$

(2)
$$\text{sgn} : \{\text{permutation}\} \to \{\pm 1\}, \quad \sigma \mapsto (-1)^m$$

if $\sigma = t_1 t_2 \ldots t_m$ if t_i's are transpositions.

Thus, we know
$$\det(A) = \sum_{\sigma} \text{sgn}(\sigma)a_{1\sigma(1)}a_{2\sigma(2)}\ldots a_{n\sigma(n)}.$$

Appendix
